Clerk's Contract and Agreement Cover Page

Year:	2008	**Legistar File ID#:**	2008-0308
Multi Year:	☐	**Amount**	$8,976,840.00

Contract Type:	Construction-AIA
Contractor's Name:	Joseph J Henderson & Son, Inc.
Contractor's AKA:	
Execution Date:	5/27/2008
Termination Date:	9/15/2009
Renewal Date:	
Department:	Public Works/Water & Sewer
Originating Person:	John Ingram

Contract Description: Main Pumping Station - East Reservoir Addition

change order #1 $20,907.03

CONTRACT CHANGE ORDER NO. 1

OWNER: Village of Orland Park, Illinois

CONTRACTOR: Joseph J. Henderson & Son, Inc.
P.O. Box 9
Gurnee, IL 60031

CONTRACT: East Reservoir Addition

DESCRIPTION OF CHANGE: See Page 2.

METHOD TO BE USED IN ADJUSTING THE CONTRACT AMOUNT:
The amount of the increase for this Change Order will be in accordance with the Contractor's proposals dated July 2009 through September 2010 and deductions for Contract Bid Items not used. See documentation summary on page 4.

ADJUSTMENT TO THE CONTRACT AMOUNT:

Original Contract Price	$8,976,840.00
Additions This Change Order	$94,453.33
Deductions This Change Order	($73,546.30)
Net Change Order Amount	$20,907.03
New Contract Price	$8,997,747.03

East Reservoir Addition

CHANGE ORDER NO. 1

1. Following excavation of the Central Reservoir Cell, cracks were found in the exterior face of the east concrete wall where leakage occurred. Upon investigation, it was determined that two of the cracks required repair. At the request of the Engineer and Owner, Joseph J. Henderson & Son, Inc (JJH) performed the requested work to seal the existing cracks, which is documented in the Extra Work Order dated July 1, 2009. This work results in an increase to the Contract Price of $3,160.05

2. Following excavation of the existing 60-inch connections points on the existing Central Reservoir Cell, it was found that the existing connection bells had become deformed from true circular shape. This required modification to the new 60-inch PCCP interconnection piping arrangements and the addition of concrete collars to stabilize the joint at the existing Central Reservoir wall. At the request of the Engineer and Owner, JJH performed the requested work to make the connection based on the identified field conditions. This is documented in the Extra Work Order dated July 1, 2009. This worked results in an increase in the Contract Price of $25,517.01

3. In order to obtain a permit to construct and operate, the Illinois Environmental Protection Agency required modifications to the project design including: addition of two access locations to the new East Reservoir Addition with above grade hatches and associated intrusion alarm system and a separate sampling system including a sample line, pump, pump shelf, and associated electrical work. The two access hatches in the top slab replaced two of the three concrete slab openings, and were tied into the Main Pump Station Alarm System. The sampling pump was installed inside the Main Pump Station and sample line installed connecting the sampling pump to the new East Reservoir Addition to provide the Owner the ability to sample the water in the new East Reservoir Addition. These modifications were added following acceptance of bids for the project. At the request of the Engineer and the Owner, JJH performed the requested work, which is documented in the Extra Work Order dated July 1, 2009. This work results in an increase in the Contract Price of.....$51,944.87

4. Associated with Item No. 3 above, it was necessary to install a new 4" DI sample line casing pipe wall pipe with water stop in the west concrete wall of the new East Reservoir Addition . At the request of the Engineer and Owner, JJH performed the requested work, which is documented in the Extra Work Order dated August 25, 2010. This work results in an increase in the Contract Price of $1,654.66

5. Following excavation of the existing Central Reservoir Cell, several cracks were found on the interior face of the east concrete wall that resulted in leakage. Upon investigation, it was determined that that numerous cracks required repair. At the request of the Engineer and Owner, JJH performed the requested work in August of 2009, which is documented in the Extra Work Order dated September 25, 2009. This work results in an increase to the Contract Price of $6,621.74

Village of Orland Park, Illinois
East Reservoir Addition

CHANGE ORDER NO. 1

6. During construction, it was determined that additional asphalt paving was desired. At the verbal request of the Owner, JJH repaved the pedestrian pathway on the west side of the site in 2010, which is documented in the Extra Work Order dated September 30, 2010. This work results in an increase to the Contract Price of $5,555.00

7. The purpose of this item is to adjust the amounts of Contract Item Nos. 3, 4, 5, and 6 to reflect the actual amounts required during the execution of the Contract Work.

   a. Decrease Contract Item No. 3, Over-excavation, from 1,000 cubic yards to 111.3 cubic yards at a unit price of $15.00 per cubic yard ..... ($13,330.50)

   b. Decrease Contract Item No. 4, Additional Select Fill, from 1,000 cubic yards to 111.3 cubic yards at a unit price of $34.00 per cubic yard ..... ($30,215.80)

   c. Decrease Contract Item No. 5, Additional Class D Concrete, from 100 cubic yards to 0 cubic yards at a unit price of $250.00 per cubic yard ..... ($25,000.00)

   d. Decrease Contract Item No. 6, Additional Steel Reinforcing, from 5,000 pounds to 0 pounds at a unit price of $1.00 per pound..... ($5,000.00)

   These decreases in unit price quantities result in a total decrease to the Contract Price of ..... ($73,546.30)

Gardner, Keith

From: John Ingram [JIngram@orland-park.il.us]
Sent: Wednesday, October 07, 2009 8:54 AM
To: Vogt, Beth
Cc: Johnson, Kenneth; Gardner, Keith; Linde, Roger
Subject: RE: OP ERA -Central Reservoir Leaks

Beth,

Inform JJH that we have two cracks (L5 and L10) on the existing reservoir that will potentially need injection filling. We can continue to monitor them over the next few days and if they self heel we will not do them. I would like to get a cost estimate for this work.

Thanks,

JJJ

From: Linde, Roger [mailto:rlinde@greeley-hansen.com]

To: Gardner, Keith; Vogt, Beth; John Ingram
Cc: Johnson, Kenneth
Subject: RE: OP ERA -Central Reservoir Leaks

The Lombard Company went through a similar leak testing program as JJH is undergoing today. I believe that the leakage expectations are much more stringent in JJH's contract than back when the original reservoir was installed and tested. I recall significant discussion about the size of the cracks and at what size of crack was remedial work required figuring that smaller cracks should self-heal.

Subject: OP ERA -Central Reservoir Leaks

Good morning. As requested I have attached several photos of the leaks in the central reservoir east wall as of today at 11:00 AM. By my count there are approximately 11 locations that are at least damp on the east wall of the central reservoir at this time. Only two of those leaks appeared to be actively weeping, L5 more so than L10 on the attached photos.

Let me know if you would like close up photos of the leaks.

Attachments: 2009_10_06_Central Reservoir Leaks North.jpg; 2009_10_06_Central Reservoir Leaks South.jpg

Mike and Jamie,

Keith has marked the visible leaks on the Central Reservoir wall. It appears that most of these are not very significant. I have attached the labeled photographs that Keith provided. Based on this information, we would like for JJH to do the following:

- Monitor the cracks over the next few days with Keith while work continues on leak repairs for the East Reservoir Addition
- Provide a change order cost estimate for repair of cracks L5 and L10 for our consideration

Based on information gathered above, we can then determine if the Village should proceed with repair of cracks L5 and L10. Let me know if you have questions on this request.

Jamie/Beth,
Below is the quotation from Hanson on the rings, our previously sent price included $1,770.00 for each ring, the current price is $2,800.00 each, please adjust the total price to $18,998.00 to reflect the additional material cost. A revised cover letter is attached.

Frank,

The price of the bell portion of the retainer ring assembly is $2800.00 each. I assume that you will still have the bolts, nuts, gasket and back ring available to make a complete retainer ring assembly. If this is not the case please let me know and we can get the price for an entire assembly.

Danny,
Can you please confirm that the the cost of the two replacement pieces we will need to purchase after we weld the two we currently have onto the existing wall pipe.

Subject: RE: Orland Park Res.

Mickey,

You should not have a problem doing it by welding the bell to the existing flange as long as you weld on the interior as your drawing shows. Also since the joint rings are zinc metalized, it is recommended that the zinc is removed in the area to be welded. You will need to either line the bell with mortar after it's installed or paint the lining in the weld area with a zinc coating.

Cc: Deremiah, Rick (Dayton) NA; Ziemer, Donn C. (South Beloit) NA
Subject: RE: Orland Park Res.

Mickey,

After talking to Donn about what you have out there, I'd suggest cutting off an 18" or 24" section of the closure cylinder and use one of the follower ring bells to make a new piece. However since the O.D. of the closure cylinder is too small to butt against the existing flange we'd need to supply you with a ring (or hardway bar in Price Brothers terminology) to weld between the flange and the cylinder. I've attached a sketch to give you an idea of what I mean. We'd also need to supply

another follower ring bell to use with the rest of the closure. Let me know if that looks like something you would want to do and we'll do an "official" drawing.

If you want, we can fabricate a new piece to mate to the existing flange or maybe to extend into the wall fitting with a plain end that's welded to the wall piece. Either option would take longer than field modifying the existing material.

Attn: Ms. Jamie Shirling

RE: Orland Park East Reservoir
Meccon Project #08-4454 rev #1

Dear Ms. Shrling,

Meccon Industries, Inc. herby submits the following change order request for installing two additional adapter rings to accept the Hanson 60" PCCP to the existing reservoir wall pipes. This price includes the work to date as detailed on the attached time and material tickets along with the not to exceed time and material pricing per the attached details. **Total Time and Material price NTE $18,988.00**

Meccon mobilized to install the south 60" PCCP connection on Monday April 6th, the east connection to the new wall sleeve was successful, this portion of the project was completed in 3hrs. Meccon then rigged the west 60" PCCP connection and lifted it into place, once in place and checked for both level and square it was secured with two 3 ton chain falls attached to a rigging beam on the east end of the cylinder and two rigging plates anchored into the existing reservoir wall. These two mechanisms were located at 9-oclock and 3-oclock, they were both operated simultaneously to ensure a straight pull into the existing wall sleeve, while a third man monitored the level and square status of the cylinder. This continued for 3hrs with several different attempts at adjustment to possibly make up for what was appearing to be an alignment issue, Meccon then removed all rigging and removed the cylinder, this allowed us to re check all dimensions and we then discovered that the existing wall pipe appeared to be "out of round". At this time we concluded the day, demobilized the crane and placed a service call to Hanson Pressure Pipe.

On Wednesday April 8th, Hanson Representitive, Don Ziemer met with Meccon at site and reconfirmed our findings from Monday afternoon. Don instructed us to wait for his engineering department to respond with a solution, this solution is attached via email, Meccon has requested a copy of such on Hanson letterhead and we will forward as soon as it arrives here.

Sincerely,

Frank L. Rowley

SECTION 04300

MASONRY

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes: Face brick

1.2 SUBMITTALS

A. General: Provide all submittals, including the following, as specified in Division 1.

B. Samples: Submit a sample of face brick to match brick on Main Pumping Station. Review sample with the OWNER.

1.3 DELIVERY, STORAGE, AND HANDLING

A. General: Deliver, store, and handle all products and materials as specified in Division 1 and as follows:

B. Masonry units: Handle masonry units in a manner to prevent undue breakage or chipping. Unload face brick, and concrete masonry units with brick clamps. Store all masonry units on platforms under shelter or in any other approved manner to protect these materials from soil and weather.

C. Rejection: Bricks and that are warped, cracked or of inferior quality will be rejected. Remove them from the Work and do not offer them again for inspection.

D. Cement and Lime: Deliver cement, lime and any other accessory materials in their original, unbroken packages or containers with the manufacturer's label thereon and store clear off the ground in weathertight sheds.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted.

1. Face Brick: The Belden Brick Company, Match Existing Brick

B. Face Brick: Provide face brick conforming to ASTM C 216 Grade SW Type FBS to match existing brick.

C. Cleaning Solutions: Use nonacidic clean water and soap powders which are not harmful to masonry work or adjacent materials.

PART 3 EXECUTION

3.1 INSTALLATION

A. General: Install brick in accordance with the manufacturer's recommendations and approved shop drawings and as specified in Division 1.

B. Environmental Conditions: Maintain materials and surrounding air temperature to minimum 50 degrees F prior to, during, and 72 hours after completion of masonry work. Do not erect masonry when the ambient temperature is below 32 degrees F with a rising or falling temperature, or when there is a probability of such a condition existing within 48 hours, unless special provisions are made for heating the materials and protecting the Work from freezing. Work will not be permitted with or on frozen materials. Use of masonry units having a film of frost on their surfaces will not be permitted.

C. Protection: Properly protect surfaces of masonry not being worked on at all times. When rain or snow is imminent and the Work is discontinued, cover the tops of exposed masonry walls and similar surfaces with a strong waterproof membrane, well secured in place.

D. Coursing: Carry masonry walls up level and plumb all around. Do not carry up one section of the walls in advance of the others, unless specifically approved.

1. Maintain masonry courses to uniform dimension. Form vertical and horizontal joints of uniform thickness.

2. Lay concrete masonry units in running bond. Course one unit and one mortar joint to equal 8 inches. Form concave mortar joints.

E. Placing and Bonding: Lay solid masonry units in full bed of mortar, with full head joints, uniformly jointed with other work.

1. Do not butter corners of joints or excessively furrow mortar joints.

2. Remove excess mortar as Work progresses.

3. Interlock intersections and external corners. Splice horizontal reinforcing at intersections and corners with a 6-inch overlap of side rods.

4. Do not shift or tap masonry units after mortar has achieved initial set. Where adjustment must be made, remove the mortar and replace it with new mortar.

5. Perform job site cutting of masonry units with proper tools to provide straight, clean, unchipped edges. Prevent broken masonry unit corners or edges.

F. Brickwork: Construct as follows:

1. Lay brickwork in common bond, unless indicated otherwise.

2. Fill all joints between bricks completely with mortar.

3. Form bed joints of a thick layer of mortar smoothed or furrowed lightly.

4. Form head joints by applying, to the brick to be laid, a full coat of mortar on the entire end, or on the entire side, as the case requires, and then shoving the mortar-covered end or side of the brick tightly against the brick laid previously.

5. Lay closure brick with a bed joint and with head joints, and place the brick carefully without disturbing the brick previously laid.

6. Test clay or shale brick daily on the job, prior to laying, to determine if they will require wetting.

7. Buttering the corners of brick and then throwing mortar or scrappings into the empty joints will not be permitted.

8. Do not use overburned or underburned, warped, spalled, cracked or broken brick where exposed.

9. Do not allow dry or butt joints.

G. Cleaning: Clean masonry work as follows:

1. Remove excess mortar and mortar smears.

2. Replace defective mortar. Match adjacent work.

3. Wash concrete masonry units with clean water and soap powder using fiber brushes.

4. Clean brickwork with 1 part commercial grade muriatic acid and 9 parts water. Clean areas not exceeding 10 to 20 square feet at a time. Soak the area to be cleaned with water, then scrub with the acid solution and rinse

with clean water. Use fiber brushes to apply the acid solution and for washing the brickwork. Do not allow the acid solution to come in contact with metalwork. Keep the brickwork below the area being cleaned wet during the cleaning process.

5. Use nonmetallic tools in cleaning operations.

H. Protection of Finished Work: Provide protective boards at exposed external corners which may be damaged by construction activities, without damaging completed Work.

END OF SECTION

SECTION 07620

SHEET METAL FLASHING AND TRIM

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes: Requirements for furnishing and installing metal flashing, counterflashing, metal reglets and roof expansion joints covers, together with all accessories necessary for a complete installation.

1.2 REFERENCES

A. Codes and standards referred to in this Section are:

1. SMACNA - Architectural Sheet Metal Manual

2. NRCA - Roofing and Waterproofing Manual

1.3 DELIVERY, STORAGE AND HANDLING

A. General: Deliver, store and handle all products and materials as specified in Division 1 and as follows:

B. Stack preformed and prefinished material to prevent twisting, bending, or abrasion, and to provide ventilation.

C. Separation: Prevent contact with materials during storage which may cause discoloration, staining, or damage.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted.

1. Sheet Metal

a. Viromet by Follansbee Steel

2.2 MATERIALS

A. Provide .015-inch fully annealed Type 304 stainless steel sheet metal, conforming to ASTM A 167, coated with (ZT) and as manufactured for building construction.

2.3 ACCESSORIES

A. Provide accessories as follows:

1. Unless shown otherwise, cleats of 26-gauge (.018-inch) zinc and tin alloy coated Type 304 stainless steel

2. Zinc/tin or pure tin solder of top quality as recommended by the sheet metal manufacturer

3. Plastic cement meeting the requirements of ASTM D 2822, Type 1.

4. Asphalt-saturated felt weighing 15 pounds per 100 square feet conforming to the requirements of ASTM D 226

PART 3 EXECUTION

3.1 PREPARATION

A. Prepare surfaces to which sheet metal will be applied which are even, smooth, sound, thoroughly clean and dry, and free from all defects that might affect the application. Cover all concrete surfaces which are shown to receive metal covering with two plies of asphalt-saturated felt.

3.2 INSTALLATION

A. General: Install flashing and trim in accordance with the manufacturer's recommendations and approved shop drawings and as specified in Division 1.

B. Install all sheet metal flashings in accordance with the manufacture's recommendations and approved shop drawings and as specified in Division 1. Make ample provisions for expansion and contraction for a watertight installation.

C. Accessories: Hem exposed edges of all flashings edges, folded back on themselves at outer edges not less than 1/2-inch to provide stiffening. Provide as required all accessories or other items essential to the completeness of the sheet metal installation, though not specifically shown or specified, to assure a watertight installation.

D. Seams: Lock all seams, except loose locked seams, and mallet flat and solder for their entire length. Flatten before soldering is done and finish 1-inch wide, unless

otherwise specified. Fold and flatten longitudinal seams in the direction of water flow. Provide loose lock seams that are loose, flat locked seams, malleted flat, and finished not less than 1-inch wide, and completely fill with an approved plastic cement.

E. Joints: Solder metal joints watertight for full metal surface contact. After soldering, wash metal clean with neutralizing solution and rinse with water.

F. Soldering: Solder slowly with well heated sheet metal to heat the seams thoroughly and fill them completely with solder. Solder in strict compliance with the manufacturer's recommendations.

G. Sealing: Seal metal joints watertight.

H. Interfacing: Where sheet metal touches nonferrous metals, paint both surfaces with a heavy coating of an approved bituminous compound paint thinned to brushing consistency.

I. Coordination: Perform all cutting, fitting, drilling, and other operations in connection with sheet metal required to accommodate the work of other trades performed by craftsmen skilled in sheet metal work.

J. Manufacturer's Recommendations: Install sheet metal flashing and trim in accordance with the recommendations of the sheet metal manufacturer and SMACNA and NRCA manual recommendations.

3.3 CLEANING AND PAINTING

A. Clean all sheet metal after soldering. Wash with an approved neutralizer and rinse with water to remove flux and acid.

END OF SECTION

(NO TEXT FOR THIS PAGE)

SECTION 07724

ACCESS HATCHES

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes: Shop-fabricated access hatches with integral support curb and operating hardware.

B. Related Work Specified in Other Sections Includes, But is Not Limited to, the Following:

1. Section 05500 - Metal Fabrications

1.2 SUBMITTALS

A. General: Provide all submittals, including the following, as specified in Division 1.

B. Installation Instructions: Submit the manufacturer's installation instructions, including special installation criteria and interface with adjacent components.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted.

1. Roof Hatches: The Bilco Company - Type NB-50C (30 x 54)

2.2 ROOF HATCHES

A. Material: Provide access hatches constructed of 3/16-inch aluminum, with all hardware of 316 stainless steel. Provide hatches with fully welded corner joints on cover and curb.

B. Size: Provide access hatches with a clear opening of 30 inches by 54 inches and as shown. Length denotes hinge side.

C. Integral Aluminum Curb: Provide hatches fabricated from 3/16-inch aluminum with 1-inch rigid fiberboard insulation, a 3-1/2-inch flange with 7/16-inch holes for mounting, and 11 gauge aluminum integral cap flashing to receive flashings. Manufacturer the hatches to a 12-inch height.

D. Aluminum Cover: Provide 3/16-inch aluminum cover with 3" overlapping flange, 1-inch fiberglass insulation sandwiched by 18-gauge aluminum interior liner, and continuous EPDM gasket bonded to the cover to provide weathertight seal. Provide cover that supports a minimum of a 40 psf live load with a maximum deflection of 1/150th of the span. Provide cover with a keyed cylinder, deadbolt type lock for keyed exterior access and turn knob operation from inside the hatches. Provide the lock with a gasketed, threaded deck plate.

E. Indicator Switches: Provide each hatch with an indicator switch. Provide Honeywell BZE6-2RQ Series E6 type indicator switches with top plunger actuators, 1NC 1NO SPDT Snap Action. The indicator switches will be wired into the pump station alarm system.

F. Hardware: Provide hardware as follows:

1. Compression spring operator and shock absorbers. Provide springs with an electrocoated acrylic finish.

2. Manual pull handle for interior and exterior operation

3. Hold open arm with vinyl covered grip handle for easy release

4. Heavy-duty pintle type hinges

5. Provide all hardware of 316 stainless steel.

2.3 FABRICATION

A. Fabricate components free of visual distortion or defects. Weld corners and joints. Fit components for weathertight assembly.

PART 3 EXECUTION

3.1 INSTALLATION

A. General: Install all access hatches in accordance with manufacturer's recommendations and approved shop drawings and as specified in Division 1.

B. Coordination: Coordinate with installation of related flashings for weathertight installation.

C. Finishing: Apply bituminous paint on surfaces of units in contact with cementitious materials or dissimilar metals as specified in Section 09900.

END OF SECTION

SECTION 11318

SAMPLING PUMP

PART 1 GENERAL

1.1 SUMMARY

A. Sampling Pump: Furnish one positive displacement, peristaltic type pump, utilizing flexible tubing and spring loaded roller or track. Provide pumps with motors, local controls, and all appurtenances necessary for a complete installation. Locate the equipment in the Pumping Station lower level.

B. Related Work Specified in Other Sections Includes:

1. Section 09900 - Painting
2. Section 15061 - Sampling Piping and Accessories

1.2 REFERENCES

A. Codes and standards referred to in this Section are:

1. Hydraulic Institute

1.3 SYSTEM DESCRIPTION FOR SAMPLING PUMP

A. General: Provide pump consisting of a fixed track with hinged guard door or cover with safety interlock switch, screw down or ratchet type tube retainer mechanism, spring loaded or gear driven roller rotor assembly with guide pins and integral variable speed drive. The magnetic interlock switch will render the drive inoperable when opened. Meet the requirements of NSF standards for potable water service for items in contact with the pumped fluid.

B. Operating Requirements: Furnish and install pump capable of pumping 50 gph at 220 rpm. Supply pumps capable of developing a continuous discharge pressure of 10 psig.

C. Fluid Character: Provide pump and appurtenances suitable in all respects and construction for sampling potable water.

1.4 SUBMITTALS

A. General: Provide all submittals, including the following, as specified in Division 1.

B. CONTRACTOR's Drawings: Submit working drawings, including arrangement and erection drawings of the equipment and control equipment.

C. Quality Control Submittals:

1. Manufacturer's certified performance and material records as required, including pump performance curve, parts list and cross section drawings.

2. For all materials in contact with the pumped fluid, provide certification of capability for use with potable water based on NSF standards.

D. Operation and Maintenance: Submit an operation and maintenance manuals for the pump.

1.5 DELIVERY, STORAGE AND HANDLING

A. Deliver, store and handle pumps and materials as specified in Division 1.

1.6 SPARE PARTS

A. Furnish the following spare parts for the metering pumps:

1. One roll of 10 feet of NSF approved tubing having a wall thickness of 2.4 mm and an ID of 9.6 mm.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Acceptable manufacturers are listed below.

1. Watson-Marlow/Bredel Inc. Model No. 520S/R2
2. Masterflex

2.2 SAMPLE PUMP CONSTRUCTION

A. Equip the rotor assembly with 316 stainless steel compression rollers. Provide pumps arranged so that one roller will be fully engaged with the tubing providing complete compression at all times to prevent back flow or siphoning. Provide pumps where the pumping action is created by the compression of the pump hose and its subsequent return to original shape causing a vacuum effect to draw the fluid into the suction side of the hose. Provide a factory set hose compression.

B. Secure the pumphead to the drive via self locating screws.

C. Flow through the hose will be in the direction of the rotor rotation which can be reversed.

D. Construct pump in which the process fluid will only be in contact with the inside of the pump tubing. Provide pump tubing that is NSF approved and suitable for use in peristaltic pumping service. Provide tubing having a wall thickness of 2.4 mm and an ID of 9.6 mm.

E. Design the pump with the tubing in contact with the inside diameter of the track (housing) and being held in place on the suction and discharge by a hand adjustable clamp mechanism. Tube clamps requiring tools are not acceptable. The tubing will be replaceable with no disassembly of the pumphead and without the use of tools.

F. Provide pumps capable of self priming when completely dry with a suction lift capability of up to 20 feet of water. Pumps must be capable of running dry without damaging effects to the pump or hose.

G. Provide pumps that use no check valves or diaphragms and do not utilize any dynamic seals in contact with the pumpage.

H. Construct the track (housing) of PPS/Ryton or of cast Aluminum coated with Trimite Polyester.

I. Provide pumps that require no special tools for regular maintenance.

2.3 DRIVE

A. Provide drives rated for continuous 24 hours operation at ambient temperature to 40 degrees C (104 degrees F).

B. Provide pump drive of the close coupled and self aligning type, requiring no flexible couplings.

C. Drive speed must be infinitely variable throughout the complete range.

D. Control drive speed, pumping direction, and starting via liquid tight controls mounted on the front panel.

E. Design on/off contact to be functional in either manual or analog mode.

F. Locate manual or analog mode selectable via keypad or position rotary selector switches on front panel.

G. Provide pump having non-maintained maximum speed switch for purpose of priming.

H. Select voltage between 100-120 v, 60 Hz, 1-phase via 2 position slide type switch recessed to protect from incidental contact. Provide standard 120 v type power cord with 3 prong plug and twenty feet in length routed through liquid tight cord clamp.

I. Provide a brushless permanent magnet DC drive motor with integral gearbox.

J. Provide IP31 rated drive enclosure.

K. Provide an ABS molded drive enclosure or coat the enclosure as follows:

1. Top and bottom casing - Trimite Polyester powder, electrostatically applied and baked.

2. Front and rear panels - Trimite Polyurethane coating, spray applied and baked.

2.4 ACCESSORIES

A. Fiberglass stand: Provide a fiberglass wall-mounted stand on which to install the sample pump. Design the stand such that the pump is located a minimum of 3'-0" from the floor. Arrange the wall mounted stand with suitable bracing located below the stand. Affix the stand and bracing to the pump station wall using suitably sized expansion anchors. Provide a stand with horizontal surface on which to locate the pump that exceeds the plan dimensions of the pump by six (6) inches in both length and width.

2.5 OPERATION, MONITORING AND CONTROL

A. General: Provide the following items integral to each pump.

1. LED display of rpm

2. Manual speed control via front panel single turn potentiometer.

3. Manual control of start, stop, direction and priming.

2.6 SOURCE QUALITY CONTROL

A. Provide drive and pumphead with one year warranty from date of shipment and covering the drive and pumphead assemblies for manufacturing defects on non-consumable components.

PART 3 EXECUTION

3.1 INSTALLATION

A. Arrange the pumping equipment as shown and suitable for installation in the spaces as shown without appreciable revision of the piping. Locate piping connections to preclude any appreciable change in the arrangement of the lines.

3.2 FIELD QUALITY CONTROL

A. Field Tests: After installation of the pumping units and all appurtenances, subject the pumping unit to a field running test under actual operating conditions.

3.3 CLEANING

A. Clean the pump exterior prior to turning over to the OWNER.

END OF SECTION

(NO TEXT FOR THIS PAGE)

SECTION 15061

SAMPLING PIPING AND ACCESSORIES

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes: Requirements for furnishing and installing all small piping, tubing, and accessories for a complete sampling system installation.

B. Related Work Specified in Other Sections Includes, But is Not Limited to, the Following:

1. Section 11318 – Sampling Pump

1.2 REFERENCES

A. Codes and standards referred to in this Section are:

1. American National Standard Institute (ANSI)
2. American Society of Mechanical Engineers (ASME)
3. American Society for Testing and Materials (ASTM)
4. American Water Works Association (AWWA)
5. American Welding Society (AWS)

1.3 SUBMITTALS

A. General: Provide all submittals, including the following, as specified in Division 1.

B. Provide submittals for all piping, valves and other appurtenances. Include in the submittals shop drawings, manufacturer's data and certifications, installation instructions, assembly drawings, electrical connection diagrams, operating characteristics and dimensions.

C. Submit the following manufacturer's certificates:

1. Furnish certificates to verify that all materials in contact with potable water have NSF Standard 61 approval.

1.4 QUALITY ASSURANCE

A. Furnish all valves of the same type from the same manufacturer. Provide parts that are interchangeable for all valves of the same type and size.

1.5 DELIVERY, STORAGE AND HANDLING

A. General: Deliver, store and handle all products as specified in Division 1 and as follows.

1. Take extreme care in loading and unloading the pipe, fittings.

2. Under no condition is the pipe to be dropped, bumped, dragged, pushed or moved in any way which will cause damage to the pipe, lining or coating.

3. If any piping or fittings are damaged in the process of delivery, storing, handling, or laying, replace or repair such piping or fittings as approved at no additional cost to the OWNER.

4. Deliver piping from the factory in bagged, capped and sealed condition. Maintain such condition for storage of piping until the piping is installed.

5. Deliver and store fittings that are capped, bagged in polyethylene bags and heat sealed. Maintain such condition for storage of fittings until such time that the fittings are installed.

PART 2 PRODUCT

2.1 MANUFACTURERS

A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted.

1. Flexible Sampling Tubing
   a. Tygothane Pressure Tubing (Manufactured by Norton Performance Plastics, Akron, OH)

2.2 MATERIALS

A. Stainless Steel Pipe and Fittings

1. Stainless Steel Pipe: The sampling pipe shall be ASTM A312, TP316L, Schedule 80, seamless.

2. Fittings: Provide fittings of Type 316L stainless steel per ASTM A SA479 or ASTM-SA182-F316, threaded or screwed. Seal fittings with Teflon tape or joint compound bearing NSF certification for use with potable water.

3. Stainless steel bolts, washers nuts and hardware: Provide items of 316 stainless steel.

B. Flexible Sampling Tubing: Provide an over braided reinforced flexible tubing system suitable of for use with potable water in accordance with NSF standard 61.

1. Provide Tygothane Pressure Tubing as manufactured by Norton Performance Plastics and supplied by Cole-Parmer or equal.

2. Install the flexible tubing with no intermediate joints.

3. Transition Fittings: Provide tubing to stainless steel transition fittings, Type 316.SS Cam Lever couplings (Items A and C) as manufactured by Sani-tech, Inc. Lafayette, NJ, or equal.

PART 3 EXECUTION

3.1 INSTALLATION

A. General: Install in accordance with the following:

1. The dimensions shown on the Contract Drawings for the locations of pipe lines have been established with the intent that there will be no interferences.

2. Install all piping in such a manner that it may be easily removed for maintenance and repair. Provide an adequate number of unions in sampling pipe runs to facilitate dismantling or removal of pipeline sections without disturbing adjacent branch or connecting lines.

3. Install all pipe lines straight and true in alignment grade, and location indicated, designated, or required, and in a workmanlike manner.

4. Adequately brace and block, tie or support the pipe and fittings for satisfactory installation. Make ample provisions for flexibility in all pipelines.

5. Provide Type 316L stainless steel metal shapes, plates, and bars used for shims meeting ASTM A276-91A.

6. Inspect pipe joints for leakage prior to burial.

B. Comply with the following for all threaded joints:

1. Assemble all threaded joints using NSF 61 approved lubricant. Use "Gimme the Green Stuff!" by Jomar Seal.

2. Apply the lubricant to male threads only.

3. Where pipe lengths are cut, properly ream the edges to the full diameter of the pipe and thoroughly clean of all chips.

4. Clean inside of threaded pipe of lubricant prior to assembly.

C. Conform with the following for welding of the pipes:

1. In accordance with latest editions of Section IX, ASME Boiler and Pressure Vessel Code and the American National Standard Code for Pressure Pipe, ANSI B31.2 and B31.3, as applicable.

D. Provide all unions in accordance with:

1. Install adjacent to threaded devices and in all locations required to permit easy removal of the devices and piping.

2. The use of running threads or right and left hand couplings instead of unions will not be permitted.

E. Comply with the following for all hangers and supports for pipes:

1. Support all piping in an approved manner to prevent damage or the loosening of joints.

2. Make all pipe hangers, support and accessories of Type 316 stainless steel, and of the type and size as approved by the Construction Contract Administrator for the particular application.

3. The distance between supports for horizontal piping, unless otherwise specified, shall not exceed 10 feet.

4. Provide lateral supports for the vertical runs of piping and the distance between these supports shall be as shown and shall not exceed 5 feet.

3.2 CLEANING

A. Cleaning: Swab and flush with clean water all process and potable water pipelines.

B. Leakage: Test pipes at the pressures specified in Section 02516 - Leaking Tests.

3.3 DISINFECTION

A. Disinfect all potable water pipelines in accordance with Section 02512 - Disinfection.

Subject: RE: More Questions on Openings - Orland Park
Attachments: 14601-S2.pdf; SD003.pdf; Neenah Casting 6665-1PH.pdf

Jamie,

The revisions to Drawing S2 that are bubbled answers the locations questions and SD03 gives the orientation.

To be clear:

1. WILL THE NEW CASTING IN "C" BE PLACED AT THE SAME LOCATION AS THE 36" DIA. ONE SHOWN NOW? THE CENTER LINE WILL BE 9'-3" FROM EACH COL.LINE AND PLACED TO CLEAR THE WALL BELOW
   Answer: Yes the new casting is in the same location as the original 36" diameter casting was going to be 9'3" from each column line. See revised drawing S2. Yes, the opening, which is actually 26" x 29" clear access needs to clear the wall below.

2. WHERE WILL THE OTHER CASTING IN "P" BE LOCATED?
   Answer: The new casting in P is 8'-8.5" from each column line and needs to clear the wall below. See revised drawing S2.

3. WE WILL DELETE THE TWO LIFT-OUT SLABS IN "B" AND "V".
   Answer: Yes the two 5'-0" removable slabs in B and V are being eliminated. The only removable slab remaining is in slab O.

4. WHICH WAY DOES THE LONG SIDE OF THE NEW CASTINGS GO? THE INSIDE DIMENSIONS ARE 30" x 27".
   Answer: The short side of the casting is parallel to the outside wall of the reservoir. The actual clear dimensions of the access opening are actually 26 x 29. This is shown in drawing SD03 in the section 2/SD03 where the 29" dimension is perpendicular to the outside wall. Thus, for the casting in slab C, the short side is east-west running and for slab P the short side is north-south running.

I have attached the revised drawings S2, SD03 and the casting cut sheet to this email. Let me know if you have further questions. It is great news that the castings will be coming soon and that the top slabs work is proceeding.

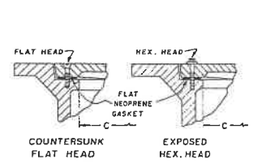
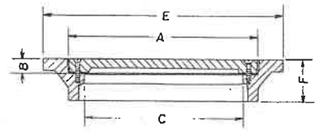
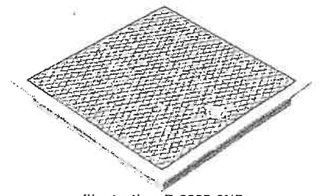
Manhole Frame, Bolted/Gasketed Lid

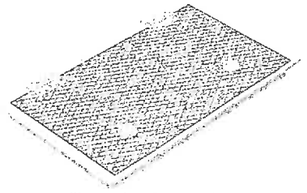
Light Duty







Illustrating R-6665-0NP



Illustrating R-6665-1KH

Square and rectangular sizes in this series furnished standard with countersunk stainless steel flat head cap screws, flat neoprene gasket, Type G lift handle and, when so indicated, Type R stainless steel butt hinge.

All units available in cast aluminum or bronze for spark proof application.

Units are shipped assembled with gasket glued to frame.

The specific location and number of hinges, handles and pickholes on these units may vary depending on the size and shape of the lids, and may not be exactly as illustrated. If the location and number of hinges, handles or pickholes is critical on your particular project, please specify requirements.

SECTION 04050

MASONRY MORTAR AND GROUT

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes: Cement, sand, aggregate admixtures and water for use in masonry mortar and grout.

1.2 REFERENCES

A. Codes and standards referred to in this Section are:

1. ASTM C 91 - Masonry Cement
2. ASTM C 144 - Aggregate for Masonry Mortar
3. ASTM C 150 - Portland Cement
4. ASTM C 207 - Hydrated Lime for Masonry Purposes
5. ASTM C 270 - Mortar for Unit Masonry
6. ASTM C 231 - Air Content of Freshly Mixed Concrete
7. ASTM C 404 - Aggregate for Masonry Grout
8. ASTM C 476 - Grout for Masonry
9. ASTM C 780 - Preconstruction and Construction Evaluation of Mortars for Plain and Reinforced Unit Masonry
10. ASTM C 1019 - Sampling and Testing Grout
11. Brick Institute of America Research Report No. 15
12. ACI 530.1/ASCE 6-92 - Specifications for Masonry Structures

1.3 SUBMITTALS

A. Provide all submittals as specified in Division 1.

1.4 DELIVERY, STORAGE AND HANDLING

A. General: Deliver, store and handle all mortar and grout materials as recommended by the manufacturers and as specified in Division 1 (and as follows:)

PART 2 PRODUCTS

2.1 CEMENT

A. Provide cement that is a domestic product from an approved source. Provide standard Portland cement meeting the requirements of ASTM C 150 Type I or Type II.

2.2 AGGREGATE

A. General: Provide fine aggregate for mortar that is natural sharp sand meeting the requirements of ASTM 144.

B. Fine Aggregate: Provide fine aggregate for masonry grout that is natural sand meeting the requirements of ASTM C 404 Size No. 2.

C. Coarse Aggregate: Provide coarse aggregate for masonry grout that is crushed stone meeting the requirements of ASTM C 404 Size No. 8.

2.3 HYDRATED LIME

A. Provide hydrated lime meeting the requirements of ASTM C 207.

2.4 WATER

A. Provide clean water furnished from approved sources to mix mortar and grout. Use water that does not contain deleterious amounts of acids, alkalies or organic materials.

PART 3 EXECUTION

3.1 MEASUREMENT AND MIXING

A. Measurement of Materials: Measure materials for mortar and grout by either volume or weight such that the specified proportions can be controlled and accurately maintained. Measurement by shovel will not be accepted.

B. Mixing Mortar and Grout: Mix all cementitious materials and aggregate for at least 3 minutes, and not more than 5 minutes, in a mechanical batch mixer, with a sufficient amount of water to produce a workable consistency.

C. Retempering: Retemper mortars that have stiffened, because of evaporation of water, by adding water as frequently as needed to restore the required consistency. Place mortar and grout in final position within 2-1/2 hours after initial mixing.

D. Proportions:

1. Masonry Mortar: Mix masonry mortar meeting the requirements of ASTM C 270 Type N with volume proportions of 1 part of Portland cement, 1 part hydrated lime and 6 parts of sand measured in a damp loose condition.

2. Masonry Grout: Mix masonry grout meeting the requirements of ASTM C 476 with volume proportions of 1 part Portland cement, 0.10 parts hydrated lime and 3 parts fine aggregate measured in a damp loose condition.

Cc: Johnson, Kenneth; David, Ray; Linde, Roger; John Ingram
Subject: 4" DI Sample Tap Carrier Pipe Sketch
Attachments: DOC032509.pdf

Attached please find a sketch of the 4" DI Sample Tap Carrier Pipe. The first page of the sketch provides location for the line. It is to be approximately 4.5' south of the south wall of the existing reservoir running directly E-W from the pump station to the new east reservoir. The line CL EL should be approximately 691.0.

Based on information from Frank, he will get a 8 foot section of F x PE DI pipe and weld on a water collar. As he can't get it drill and tapped for studs in time to maintain schedule, the flange end will need to extend approximately 6" into the reservoir so that a tapped blind flange can be added later. Later the outside end of the pipe will be cut for a MJ joint within 2-3 feet of the exterior of the reservoir wall. It is my understanding that this can be done to stay on schedule for the Friday pour of the reservoir upper wall at slab E.

To use this approach, JJH will have to cut holes into the forms. I have discussed this with Mike and he is prepared to do it rather than waiting to get a tapped flange. I have indicated to Mike that the exact elevation can be varied to avoid the rebar grid.

Let me know if you have further questions. I will likely be at the site tomorrow to look at the 36" water main joints. A final time has not been confirmed for this meeting yet, but we are planning for around 2 pm.

Date: 09/25/09

Job #: 1224-00 Job Name: Orland Park Reservoir Addition

Work Performed For: **Greeley and Hansen & Village of Orland Park**

NOTIFICATION		
Person Directing or Notified of Work:	Beth Vogt	Date Notified: 07/29/09
Method of Notification:	E-mail	

Reason for Change (in detail): Owner and Engineer requested pricing for caulking of existing cracks in original reservoir. Work consisted of 2 men for two 8 hour days each, interior and exterior, as well as 5 hours for 2 men set up (performed on 8-17) and 5 hours for two men for dismantling and loading equipment. 4 hours each for mob /demob of scaffolding for Operator/Lull.

Description of Work: Provide all labor, material and equipment necessary to seal those cracks specifically listed in Ray David's e-mail of 4-30-09.

Photographs Taken? Yes No

Subject: Proposal for repair of cracks in the existing reservoir and form tie end painting
Attachments: Five Exterior Water Marks on East Side of Existing Reservoir.pdf; Crack A (Furthest S).jpg; Crack B.jpg; Crack C.jpg; Cracks D.jpg; Crack E.jpg; Crack F.jpg; Crack G (Furthest N).jpg; View of Roof of Northern Portion of Existing Reservoir.jpg; View of Roof of Southern Portion of Existing Reservoir (Looking S).jpg; WFLEXGEL2.pdf

Jamie,

Please provide a change order proposal to perform crack sealing on cracks having opening larger than 10 mil (0.01") in the existing reservoir using the Sikaflex -1a or a Hydrophilic Polyurethane Flexible Injection Grout such as the Wflexgel2, for which the information is attached. The email below and attached pictures identify the locations for the cracks to be repaired. Also, there are some form tie ends in the existing reservoir that are rusted. Please indicate the change order cost to , clean and paint these ends with a rust inhibitor paint.

From: David, Ray
Sent: Thu 4/30/2009 10:06 AM
To: Vogt, Beth; John Ingram (JIngram@orland-park.il.us)
Subject: OP ERA - Measurements of Cracks On East Side of Existing Reservoir

Good morning. Following John's walk-through of the south half of the east side of the existing reservoir last week, it was noted that there were some cracks seen on the east interior wall. John and I went outside to see if they matched the locations I had previously marked during the excavation phase of the project with a few looking like they did.

Since the marks have faded since then and were made at a higher elevation, I transposed those five marks on the exterior east wall of the existing reservoir at the site's current elevation. In addition, I went inside the reservoir and took note of any noticeable cracks or water marks. There were seven location I identified from the inside of the existing reservoir which I have labeled A (most southern) through G (most northern).

I have attached a few pictures of the east exterior of the existing reservoir as well as pictures of the cracks inside. Below are the rough measurements I took of the location of these cracks with those numbered 1 (most southern) through 5 (most northern) referring to exterior cracks and the lettered locations interior locations. All measurements are taken with respect to the exterior south edge of the reservoir at the current elevation (I added the wall thickness to the interior measurements I took).

Exterior Measurements
1. 21'-10"
2. 40'-7"
3. 51'-8"
4. 78'-5"
5. 93'-5"

Interior Measurements
A. 21'-6"
B. 42'
C. 54'-3"
D. 67'-7"
E. 78'-1"

F. 81'-9"
G. 96'-11"

Based on these approximate measurements, it seems there are exterior and interior matches: 1 with A; 2 with B; 3 with C; 4 with either E or F; and 5 with G. I have also attached a few pictures showing a few water marks on the roof of the existing reservoir.

Thanks,
Ray David

PRODUCT DATA SHEET

WEBAC Corp. *FLEXGEL 2*

HYDROPHILIC POLYURETHANE FOAM - GEL SINGLE COMPONENT

Approved for contact with potable water in accordance with NSF Standard 61 use level 15cm² / liter

TYPE OF MATERIAL

WEBAC FLEXGEL is a single component hydrophilic polyurethane grout. **Underwriter's Laboratories , Inc. has tested WEBAC Corp. Flexgel2 in accordance with NSF standard 61, and has approved this material for contact with potable water at a maximum use level of 15cm²/liter.**

The product cures to a closed cell foam or an elastomeric gel when it comes in contact with water. The product is capable of incorporating large amounts of water that are multiples of its own mass, thereby forming a gel. The cure time of the product is determined by the amount of water added and the temperature.

While reacting to a foam the material expands its volume. The cured material is flexible. Since water is a component of the cured product structure, the material can be effected by wet and dry cycles. The reacted material may shrink and swell as a result of the surrounding moisture content.

The capability of the cured product to swell and increase in volume due to water absorption is one of the important features that discriminate hydrophilic grouts from their hydrophobic counterparts.

WEBAC Flexgel is designed as a single component material. In certain applications an accelerator may be added to decrease gel-time.

RANGE OF APPLICATION

- **Stop water infiltration**
- **Sealing joints**
- **Sealing of pipe joints through commercial packer equipment for repairing leakages in sanitary and storm sewer pipes**
- **Pipe Intrusions**
- **Sewers, Manholes, Utility Boxes**
- **Tunnels, Dams**
- **Soil Stabilization**

PROCESSING

WEBAC FLEXGEL is cured upon reaction with water. Large quantities of water can be absorbed in the reaction mass, and the properties of the cured product are determined by the mix ratio.

Mixing WEBAC FLEXGEL with water at a 1:1 to 1:3 volume basis will result in a foam with good tear resistance.

In the range of 1:4 to 1:10 a gel is obtained. Lower water ratios result in a strong gel of a light cellular structure. The more water is added the gel gradually softens and the cellular appearance changes towards a monolithic structure. The gel time is about 100 seconds varying with temperature and water saturation.

Single component injection equipment may be used to achieve certain results. Hydrophilic grouts can absorb large amounts of water and simultaneous injection of water might be recommended in applications where gelling of the grout is desired. Two component equipment can may utilized to achieve a certain mixing ratio such as needed for commercial sewer repair. The grout can be applied much in the same manner as acrylamide grout with the advantage of having superior strength and safety features.

For 'curtain injection' behind below grade structures it is recommended to drill through the structure in a pattern that is determined by the physical properties of the soil. To create a standard pattern holes are drilled 50 cm (two feet) apart from each other in a horizontal line. The next step is to drill holes in a line 50 cm above the first line in the same fashion but staggered. Recommended packers are WEBAC 19-150 buttonhead type. Smaller packers like the 1/2" 13-60s type may be sufficiant in some lower volume applications

Injection should begin at the highest point. Each packer should be injected until material penetrates the surrounding drill holes (open packers). After injection is complete packers should be removed and drill holes be filled with a cementitious grout.

It is essential for all equipment that comes in contact with the grout to be dry. If reaction of the batch occurs while pumping, immediately shut down the machine and flush with a cleaner to avoid built up and clogging of the equipment.

Observe temperature and humidity of the environment, since both determine the pot-life of the batch.

MAINTENANCE OF EQUIPMENT

Remove all excess sealant and any smears. Tools and mixing equipment are best cleaned immediately after use. WEBAC provides R70 Pump Flush, a solvent free, nonflammable, nonhazardous cleaner. Xylol, Toluol, Acetone and M.E.K. can be used if not in conflict with regulations on jobsite. Circulate cleaner through pump for several minutes. Caution! Some cleaners are combustible.

PRECAUTION

While working with WEBAC materials safety goggles, gloves and safety clothing should be worn at all times. Also observe container labels, MSDS, and instructions in the WEBAC Product Catalog. In case one of the components comes in contact with the skin, wash thoroughly with soap and water. Adequate ventilation in volume and pattern should be provided in working area. Further protection: emergency showers and eyewash stations.
