EXECUTIVE SUMMARY

Kimley-Horn and Associates, Inc. (Kimley-Horn) prepared a traffic impact study for a retail development proposed on the southwest quadrant of the intersection of 159th Street (US 6)/LaGrange Road (US 45) in Orland Park, Illinois. The development would include a 230,667 square-foot retail building and 45,000 square feet of retail/restaurant outlots.

Access to the site would be provided via driveways to 159th Street, LaGrange Road, and 161st Street. Per coordination with the Village of Orland Park, Ravinia Avenue will be extended east to connect to 161st Street. One right-in/right-out (RIRO) driveway to 159th Street (Access A) would primarily facilitate truck traffic outside the peak hours. One RIRO driveway to 159th Street (Access B) would align with an existing commercial driveway on the north side of 159th Street. One RIRO driveway to LaGrange Road (Access C) and three full-movement driveways to 161st Street (Access D-Access F) will also be provided.

As part of this study, the existing roadway network was analyzed to determine the current operations at the study intersections. In order to assess the potential impact on the area roadway network, site-generated trips were established and added to future background volumes. The development is anticipated to be operational in 2028, and so for purposes of this analysis traffic conditions were evaluated for Build 2033 (build-plus-five years), per Illinois Department of Transportation (IDOT) guidelines. Additionally, per input from the Village of Orland Park, Year 2050 was analyzed to assess future potential impacts.

Based on a review of future traffic conditions, IDOT *Bureau of Design and Environment (BDE) Manual* criteria for turn lanes, and *Manual on Uniform Traffic Control Devices* (MUTCD) traffic signal warrant criteria, the following improvements were included in the analysis of future conditions.

All study access driveways should include one inbound and one outbound lane and operate under minor-leg stop control. An eastbound right-turn should be provided on 159th Street at Access B. A southbound right-turn lane should be provided on LaGrange Road at Access C. A westbound right-turn lane should be provided on 161st Street at Access D.

With the Ravinia Avenue extension, dual northbound left-turn lanes and an eastbound right-turn lane should be installed at the 159th Street/Ravinia Avenue intersection. Additionally, at the intersection of LaGrange Road/161st Street, a traffic signal should be provided and is currently under design based on coordination with the Village of Orland Park. Dual northbound left-turn lanes should be installed and be incorporated in the ongoing signal design.

Additional discussion of the analysis and recommendations is presented in *Section 4 Future Conditions* of this report.

1. INTRODUCTION

Kimley-Horn prepared a traffic impact study for a retail development proposed on the southwest quadrant of the intersection of 159th Street (US 6)/LaGrange Road (US 45) in Orland Park, Illinois. The subject site is highlighted in **Exhibit 1**.

The development would include a 230,667 square-foot retail building and 45,000 square feet of retail/restaurant outlots. To accommodate the development, the existing vacant commercial building at the northeast corner of the site would be removed. Two existing right-in/right-out (RIRO) driveways would be removed: 1) 159th Street, located approximately 175 feet west of LaGrange Road (measured centerline-to-centerline); and 2) LaGrange Road, located approximately 290 feet south of 159th Street. Access to the site would be provided as summarized below. To accommodate site access, 161st Street would be extended west across the south property frontage.

- Access A – RIRO driveway located on the south side of 159th Street approximately 900 feet west of LaGrange Road to primarily facilitate trucks.
 - This access was not included in the capacity analysis as truck trips are anticipated to occur outside of the analyzed peak hours.
- Access B – RIRO driveway located on the south side of 159th Street approximately 550 feet west of LaGrange Road, aligned with the existing commercial driveway on the north side of 159th Street (North Private Drive).
- Access C – RIRO driveway located on the west side of LaGrange Road approximately 610 feet south of 159th Street.
- Access D – Full-movement driveway located on the north side of 161st Street approximately 345 feet west of LaGrange Road, aligned with the existing driveway for the mixed-use development on the south side of 161st Street (West Access).
- Access E – Full-movement driveway located on the north side of 161st Street extension, approximately 335 feet west of Access D.
- Access F – Full-movement driveway located on the north side of 161st Street extension, located approximately 435 feet west of Access E.

This report presents and documents the study methodology, summarizes data collection and development traffic characteristics, highlights the evaluation of traffic conditions on the study intersections and roadways, and identifies recommendations to address operational impacts and integrate the proposed development into the surrounding transportation system.

2. EXISTING CONDITIONS

Kimley-Horn reviewed the subject site and surrounding area to collect relevant information pertaining to site context, surrounding land uses, the adjacent street system, current traffic volumes and operating conditions, lane configurations and traffic control at nearby intersections, and other key transportation characteristics. This section of the report details information on the existing conditions.

Area Land Uses & Connectivity

Located at the southwest quadrant of the intersection of 159th Street (US 6)/LaGrange Road (US 45) in Orland Park, Illinois, the subject site is currently a mix of undeveloped land and a vacant building at the northeast corner, zoned for mixed use (COR). The immediate surrounding area includes residential and commercial development. The site is bounded by 159th Street (US 6) to the north, 161st Street to the south, LaGrange Road (US 45) to the east, and vacant land to the west.

In the site vicinity, local north-south access is provided via LaGrange Road (US 45), located immediately east of the site, with Ravinia Avenue serving as an alternative, located northwest of the site. Local east-west access is facilitated via 159th Street (US 6), located immediately north of the site. Interstate 80 (I-80), located approximately 3.5 miles south of the site, provides regional east-west access through Illinois. LaGrange Road provides a full interchange with I-80.

Existing Roadway Characteristics

159th Street (US 6) is an east-west divided roadway along the northern boundary of the site. Through the study area, two travel lanes are provided in each direction with a landscaped center median. IDOT classifies 159th Street as a Strategic Regional Arterial (SRA). The SRA system was established by IDOT to promote mobility on key routes throughout the Chicago area by applying various strategies, such as access control and limited signalization. 159th Street is under IDOT jurisdiction. At its signalized intersection with Ravinia Avenue, 159th Street provides one dedicated left-turn lane, one through lane, and one shared through/right-turn lane on the west leg; on the east leg, 159th Street provides dual left-turn lanes, two through lanes, and one dedicated right-turn lane. A striped crosswalk with pedestrian signals is provided on both legs of 159th Street at Ravinia Avenue. At its unsignalized T-intersection with North Private Drive, 159th Street provides one dedicated left-turn lane and two through lanes on the west leg, and two through lanes and one dedicated right-turn lane on the east leg. At its signalized intersection with LaGrange Road, 159th Street provides dual left-turn lanes, two through lanes and one dedicated right-turn lane on each leg. A striped crosswalk with pedestrian signals is provided on each leg of 159th Street at LaGrange Road. 159th Street has a posted speed limit of 40 miles per hour (mph).

LaGrange Road (US 45) is a north-south divided roadway along the eastern boundary of the site. Through the study area, three travel lanes are provided in each direction with a landscaped center median. IDOT classifies LaGrange Road as an SRA roadway and is under IDOT jurisdiction. At its signalized intersection with 159th Street, LaGrange Road provides dual left-turn lanes, three through lanes, and one dedicated right-turn lane on each leg. Striped crosswalks with pedestrian signals are provided on the north and south legs of LaGrange Road at 159th Street. At its unsignalized intersection with 161st Street, LaGrange Road provides one dedicated left-turn lane, two through lanes and one shared through/right-turn lane on each leg. LaGrange Road has a posted speed limit of 40 mph north of 161st Street and 45 mph south of 161st Street.

Ravinia Avenue is a north-south divided road located approximately 525 feet west of the site. Through the study area, two travel lanes are provided in each direction with a landscaped center median provided along the segment south of 159th Street; north of 159th Street, the landscaped center median is limited. IDOT classifies Ravinia Avenue as a Local Road under the jurisdiction of Orland Park. The roadway terminates approximately 1,400 feet south of 159th Street and will be extended as part of the Ravinia Avenue/161st Street extension project. At its signalized intersection with 159th Street, Ravinia Avenue provides one dedicated left-turn lane, one through lane, and one dedicated right-turn lane on each leg. Ravinia Avenue has a posted speed limit of 30 mph.

161st Street is an east-west divided roadway along the southern boundary of the site. Through the study area, two travel lanes are provided in each direction. IDOT does not provide classification for 161st Street, and as such is assumed as a Local Road under private jurisdiction. The roadway currently terminates approximately 315 feet west of LaGrange Road and will be extended as part of the Ravinia Avenue/161st Street extension project. At its unsignalized intersection with LaGrange Road, 161st Street provides one left-turn lane and one shared through/right-turn lane on the east leg, and one dedicated left-turn lane, one through lane and one dedicated right-turn lane on the west leg. There is no posted speed limit, and for purposes of the analysis, a speed limit of 30 mph was assumed.

North Private Drive is a north-south driveway providing access to a commercial development on the north side of 159th Street. At its unsignalized T-intersection with 159th Street, North Private Drive operates under minor-leg stop control and provides two inbound lanes and two outbound lanes. For purposes of the analysis, a speed limit of 25 mph was assumed.

East Access is a north-south access driveway providing access to mixed-use development on the south side of 161st Street. At its unsignalized intersection with 161st Street, East Access provides a single inbound lane and a single outbound lane. A stop sign is not currently posted; however, for purposes of this analysis East Access was assumed to operate under minor-leg stop control. For purposes of the analysis, a speed limit of 25 mph was assumed.

West Access is a north-south access driveway providing access to mixed-use development on the south side of 161st Street. At its unsignalized intersection with 161st Street, West Access operates under minor-leg stop control and provides a single inbound lane and a single outbound lane. For purposes of the analysis, a speed limit of 25 mph was assumed.

Traffic Count Data

Weekday turning movement count data was collected in April 2025 at the study intersections listed below. These counts were conducted during the weekday morning (6:00 to 9:00 AM), weekday evening (3:00 to 6:00 PM) and Saturday midday (11:00 AM to 2:00 PM) peak periods. These count periods were selected in order to capture the peak travel periods in the area. Additionally, at the intersection of LaGrange Road/161st Street, traffic counts were collected from 6:00 AM-7:00 PM for purposes of signal warrant analysis.

- LaGrange Road / 159th Street
- 159th Street / Ravinia Avenue
- 159th Street / North Private Drive
- LaGrange Road / 161st Street
- 161st Street / West Access
- 161st Street / East Access

Note that turning movement counts were not conducted at the driveways for the existing development (159th Street and LaGrange Road) on the northeast corner of the site as the building is currently vacant.

The traffic count data indicates that peak hour traffic volumes occur within the study area from 7:30 to 8:30 AM and 4:45 to 5:45 PM during a typical weekday, and 1:00 to 2:00 PM during a typical Saturday. For purposes of the analysis, the peak hour traffic volumes were rounded to the nearest multiple of five and balanced between intersections, with two exceptions. Traffic volumes were not balanced between the following intersections due to the presence of other intersections and commercial driveways: 159th Street/Ravinia Avenue and 159th Street/North Private Drive (westbound); 159th Street/North Private Drive and LaGrange Road/159th Street (westbound); and LaGrange Road/159th Street and LaGrange Road/161st Street (northbound). A summary of existing traffic volumes is depicted in **Exhibit 2**. The traffic count data is included in the appendix.

Existing Capacity Analysis

Synchro capacity software was used to evaluate the existing operational conditions at the study intersections during the weekday AM, weekday PM, and Saturday peak hours. The capacity of an intersection quantifies its ability to accommodate traffic volumes and is expressed in terms of level of service (LOS), measured in average delay per vehicle. LOS grades range from A to F, with LOS A as the highest (best traffic flow and least delay), LOS E as saturated or at-capacity conditions, and LOS F as the lowest (oversaturated conditions). The lowest LOS grade typically accepted by jurisdictional transportation agencies in Northeastern Illinois is LOS D, and a minimum LOS C is required for through movements on SRA routes such as 159th Street and LaGrange Road.

The LOS grades shown below, which are provided in the Transportation Research Board's Highway Capacity Manual (HCM) quantify and categorize the driver's discomfort, frustration, fuel consumption, and travel times experienced as a result of intersection control and the resulting traffic queuing. A detailed description of each LOS rating can be found in **Table 2.1**.

Table 2.1 Level of Service Grading Descriptions¹

Level of Service	Description
A	Minimal control delay; traffic operates at primarily free-flow conditions; unimpeded movement within traffic stream.
B	Minor control delay; traffic operates at a fairly unimpeded level with slightly restricted movement within traffic stream.
C	Moderate control delay; movement within traffic stream more restricted than at LOS B; formation of queues contributes to lower average travel speeds.
D	Considerable control delay that may be substantially increased by small increases in flow; average travel speeds continue to decrease.
E	High control delay; average travel speed no more than 33 percent of free flow speed.
F	Extremely high control delay; extensive queuing and high volumes create exceedingly restricted traffic flow.

¹Highway Capacity Manual, 7th Edition.

The range of control delay for each rating (as detailed in the HCM) is shown in **Table 2.2**. Because signalized intersections are expected to carry a larger volume of vehicles and stopping is required during red time, note that higher delays are tolerated for the corresponding LOS ratings.

Table 2.2 Level of Service Grading Criteria¹

Level of Service	Average Control Delay (s/veh) at:	
	Unsignalized Intersections	Signalized Intersections
A	0 – 10	0 – 10
B	> 10 – 15	> 10 – 20
C	> 15 – 25	> 20 – 35
D	> 25 – 35	> 35 – 55
E	> 35 – 50	> 55 – 80
F ²	> 50	> 80

¹Highway Capacity Manual, 7th Edition

²All movements with a Volume to Capacity (v/C) ratio greater than 1 receive a rating of LOS F.

For purposes of the analysis, signal timing data was obtained from IDOT. Per IDOT standards, right-turn-on-red (RTOR) movements were not included in the analysis despite being observed in the field.

Based on these standards, capacity results were identified for the study intersections under existing conditions. The results of the capacity analysis are summarized in **Table 2.3**. In this table, the operation for each approach is quantified according to the average delay per vehicle and the corresponding LOS. Overall intersection level of service is not reported for minor-leg stop-controlled intersections, since the majority of vehicles are able to move through the intersection with little to no delay.

The 95th percentile queueing results are provided in **Table 2.4**. In this table, the storage and taper provided for each dedicated turn lane is shown, along with the projected queue length for each movement during the peak hour evaluations. Anticipated queue spillback is noted when the projected queues exceed the provided turn lane lengths. Queue lengths presented assume a vehicle length of 25 feet.

The results are based on Synchro's HCM 7th Edition reports. Copies of the capacity analysis reports are provided in the appendix.

★ -Signalized Intersection

△ -Minor-Leg Stop-Controlled Intersection

¹Left-turn movement operates at LOS E.

²Left-turn movement operates at LOS F.

³Left-turn and through movement operate at LOS E.

Under existing conditions the study network experiences operational challenges, primarily due to the high traffic volumes on the SRA routes. Per IDOT standards, through movements along SRA routes (159th Street and LaGrange Road) are expected to operate at LOS C or better. Under existing conditions, this standard is not met for most of the through movements on either SRA route. A summary of intersections, approaches, and movements estimated to operate at LOS E or LOS F are outlined below.

At the intersection of 159th Street/Ravinia Avenue, the eastbound and westbound approaches operate acceptably; however, the left-turn movements operate at LOS E or LOS F during the peak hours. The delay estimated for the left-turn movements is attributable to the relatively limited green time allocated to the protected left-turn phases. The northbound approach also operates at LOS E in the weekday morning peak hour. This delay is attributable to the signal cycle length (130 seconds weekday morning and Saturday midday peak hours; 120 seconds weekday evening peak hour) and priority given to east-west through traffic on 159th Street. As a result, relatively limited green time is allocated to the protected left-turn phases and minor-leg approaches.

At the intersection of 159th Street/North Private Drive, the southbound approach operates at LOS F during the weekday evening and Saturday midday peak hours. This delay is not uncommon for stop-controlled minor-leg streets intersecting with heavily traveled SRA routes, such as 159th Street

At the intersection of LaGrange Road/159th Street, the left-turn movements operate at LOS E in the weekday morning peak hour. During the weekday evening peak hour, the eastbound and westbound approaches operate at LOS E, while the northbound and southbound left-turn movements operate at LOS F and LOS E, respectively. During the Saturday midday peak hour, the eastbound approach operates at LOS E and the eastbound left-turn movement operates at LOS F, while the westbound, northbound and southbound left-turn movements and the westbound through movement operate at LOS E.

At the intersection of LaGrange Road/161st Street, the eastbound and westbound approaches operate at LOS F during the peak hours. This delay is common for stop-controlled minor-leg roadways intersecting with heavily traveled SRA routes, such as LaGrange Road. The northbound and southbound left-turn movements operate at LOS E or LOS F during the weekday evening peak hour; the southbound left-turn movement operates at LOS E during the Saturday midday peak hour.

★ -Signalized Intersection △-Minor-Leg Stop-Controlled Intersection

¹Queue length in feet based on an assumed 25' vehicle.

²Exceeds storage lane length.

³Exceeds storage lane and taper length.

Under existing conditions, the study network experiences high queues along multiple movements primarily due to the high traffic volumes on the SRA notes as previously noted. A summary of turning movements with queue estimates longer than the available storage length are outlined below.

At the intersection of 159th Street/Ravinia Avenue during the weekday evening and Saturday midday peak hour, the eastbound left, southbound left, and southbound right-turn queue projections are anticipated to exceed the storage length provided. The overall turn lane length (inclusive of storage and taper) is exceeded for the eastbound left-turn movement during the weekday evening peak hour. During the Saturday midday peak hour, the westbound right-turn queue projection is anticipated to exceed the storage length provided. With the exception of the eastbound left-turn queues during the weekday evening peak hour, queues associated with the movements identified are generally accommodated within the taper.

At the intersection of LaGrange Road/159th Street during the weekday morning peak hour, the northbound right queue projection is anticipated to exceed the storage length provided. In addition to the northbound right-turn spillback noted during the weekday morning peak hour, the eastbound left, southbound left, and southbound right-turn queue projections are anticipated to exceed the storage length provided during the Saturday midday peak hour. Finally, during the weekday evening peak hour, all turning movements previously noted in addition to the northbound left-turn queue projections are anticipated to exceed the storage length. For the turning movements identified with queue spillback through the provided storage, the projected queues are generally accommodated within the taper.

At the intersection of LaGrange Road/161st Street eastbound left-turn queue is projected to spillback past the provided storage and taper during all peak hours, while the westbound through/right-turn queue is projected to spillback during the weekday evening and Saturday midday peak hours.

3. DEVELOPMENT CHARACTERISTICS

This section of the report outlines the proposed site plan and summarizes site-specific traffic characteristics.

Development Characteristics

The development includes an approximately 230,667 square-foot retail building and 45,000 square-feet of retail/restaurant outlot buildings. To accommodate the development, the existing vacant commercial building at the northeast corner of the site would be removed. In addition, two existing site driveways would be removed: 1) 159th Street, located approximately 175 feet west of LaGrange Road (measured centerline-to-centerline); and 2) LaGrange Road, located approximately 290 feet south of 159th Street. To accommodate access to the development, 161st Street would be extended west across the south property frontage. Access to the site would be provided as summarized below.

- Access A – RIRO driveway located on the south side of 159th Street approximately 900 feet west of LaGrange Road to primarily facilitate trucks.
 - This access was not included in the capacity analysis as truck trips are anticipated to occur outside of the analyzed peak hours.
- Access B – RIRO driveway located on the south side of 159th Street approximately 550 feet west of LaGrange Road, aligned with the existing commercial driveway on the north side of 159th Street (North Private Drive).
- Access C – RIRO driveway located on the west side of LaGrange Road approximately 610 feet south of 159th Street.
- Access D – Full-movement driveway located on the north side of 161st Street approximately 345 feet west of LaGrange Road, aligned with the existing driveway for a mixed-use development on the south side of 161st Street (West Access).
- Access E – Full-movement driveway located on the north side of 161st Street approximately 300 feet west of Access D.
- Access F – Full-movement driveway located on the north side of 161st Street extension, located approximately 435 feet west of Access E.

Trip Generation

In order to calculate trips generated by the proposed site, data was referenced from the Institute of Transportation Engineers (ITE) *Trip Generation Manual*, 11th Edition. The trip generation data for the ITE Land Use Code (LUC) corresponding to the proposed land uses are shown in **Table 3.1**. The proposed retail store is expected to sell a wide range of goods; and therefore, LUC 815, Free-Standing Discount Store, was selected as most closely representative of the proposed retail use. For the outlots, retail and restaurant uses are anticipated; and therefore, LUC 821, Shopping Plaza (40-150k) was selected to represent a mix of tenants. Where available, the ITE fitted curve equation was referenced otherwise the average rate was used. A copy of the ITE data is provided in the appendix.

Table 3.1 ITE Trip Generation Data

ITE Land Use	Daily	Weekday		Saturday
		AM Peak Hour	PM Peak Hour	Midday Peak Hour
Free-Standing Discount Store (Site) (LUC 815)	$\text{Ln}(T) = 0.77\text{Ln}(X) + 5.05$ 50% in/50% out	$\text{Ln}(T) = 0.84\text{Ln}(X) + 0.74$ 70% in/30% out	$\text{Ln}(T) = 0.84\text{Ln}(X) + 2.30$ 50% in/50% out	$T = 7.04X$ 51% in/49% out
Shopping Plaza (40-150k) (Outlots) (LUC 821)	$T = 67.52X$ 50% in/50% out	$T = 1.73X$ 62% in/38% out	$T = 5.19X$ 49% in/51% out	$T = 7.75X - 98.93$ 52% in/48% out

T = Trips; X = Square Feet

For the purpose of this study, site generated trips are expected to exhibit multiple routing patterns when traveling to and from the subject site, as described below.

- Primary Trips** - Vehicles that travel to the subject development and then return directly to their place of origin are called “primary trips”. Primary trips reflect new traffic volumes generated by the proposed development that would approach and depart on the same route. Trips to/from the site that are not pass-by trips are expected to be primary trips.
- Pass-By** - Pass-by traffic reflects the travel patterns of motorists who are already traveling on the adjacent study roadways and stop at the site en-route to another primary destination. Data in the *ITE Trip Generation Manual*, 11th Edition, reveals that 20 percent of vehicles at a Free-Standing Discount Store (LUC 815) are pass-by trips during the weekday evening peak hour, and 24 percent of vehicles are pass-by trips during the Saturday peak hour. For purposes of the analysis, pass-by trips were not included in the weekday morning peak hour. For daily trips, ITE data for the weekday evening peak hour (20 percent) was referenced. Pass-by rates for Shopping Plaza (40-150k) (LUC 821) indicate that 40 percent of vehicles are pass-by trips during the weekday evening peak hour, and 31 percent of vehicles are pass-by trips during the Saturday peak hour. For purposes of the analysis, pass-by trips were not included in the weekday morning peak hour. For daily trips, ITE data for the weekday evening peak hour (40 percent) were assumed.

Trip generation projections for the site and outlots were estimated using the ITE data. A summary of the site-generated traffic is presented in **Table 3.2**.

Table 3.2 Site-Generated Traffic Projections¹

Land Use	Size	Weekday							Saturday		
		Daily	AM Peak Hour			PM Peak Hour			Midday Peak Hour		
			In	Out	Total	In	Out	Total	In	Out	Total
Site	230,667 SF	10,300	140	60	200	480	485	965	830	795	1,625
Outlots	45,000 SF	3,040	50	30	80	115	120	235	130	120	250
<i>Pass-by Trips (Site)</i>		-2,060	--	--	--	-95	-95	-190	-195	-195	-390
<i>Pass-by Trips (Outlots)</i>		-1,220	--	--	--	-45	-45	-90	-40	-40	-80
Net New Trips		10,060	190	90	280	455	465	920	725	680	1,405

¹Daily trips rounded to the nearest multiple of ten. Peak hour in/out volumes are rounded to the nearest multiple of five.

Directional Distribution

The estimated distribution of site-generated traffic on the surrounding roadway network as it approaches and departs the site is a function of several variables such as prevailing traffic volumes/patterns, characteristics of the street system, and the ease with which vehicles can travel over various sections of that system. **Table 3.3** presents the anticipated directional distribution from which vehicles travel to and from the site.

Table 3.3. Directional Distribution

Traveling to/from	Trip Distribution Percentages
East on 159 th Street	25%
West on 159 th Street	15%
North on LaGrange Road	25%
South on LaGrange Road	30%
North on Ravinia Avenue	5%
Total	100%

The site traffic assignment, representing traffic volumes associated with the proposed development at the study intersections, is a function of the estimated trip generation (Table 3.2) and the directional distribution (Table 3.3). Based on these assumptions, primary site trip assignment is depicted in **Exhibit 3**, and pass-by site trip assignment is shown in **Exhibit 4**. For the outlots, primary site trip assignment is depicted in **Exhibit 5**, and pass-by site trip assignment is shown in **Exhibit 6**. The total site-generated traffic is illustrated in **Exhibit 7**.

4. FUTURE CONDITIONS (2033)

This section of the report develops future traffic projections for analyses. The project was assumed to be completed in 2028. Therefore, Year 2033 traffic projections were developed for the analysis, which reflects a build-plus-five years, per typical IDOT requirements.

Future (2033) No-Build Traffic Projections

Background traffic growth estimates were developed using Year 2050 data from the Chicago Metropolitan Agency for Planning (CMAP). As summarized in **Table 4.1**, the average annual growth rate for the area roadway network is approximately 0.61 percent. An annual compounded growth rate of 0.61 percent was applied for the period of eight years to reflect traffic growth between Year 2025 (existing traffic counts) and future Year 2033.

Table 4.1 CMAP Projected Growth Rates

Roadway Segment	CMAP Projected Annual Growth Rate
159 th Street, west of 104 th Avenue	0.62%
159 th Street, between 104 th and LaGrange Road	0.62%
159 th Street, east of LaGrange Road	0.62%
104 th Avenue, south of 159 th Street	0.60%
Ravinia Avenue, north of 159 th Street	0.59%
LaGrange Road, north of 159 th Street	0.61%
LaGrange Road, south of 159 th Street	0.61%
Average Annual Growth Rate	0.61%

Per input from the Village of Orland Park, by Year 2033, Ravinia Avenue would be extended east to connect to 161st Street. Due to this new connection, it was estimated that 25 percent of eastbound right and northbound left-turning traffic at LaGrange Road/159th Street would utilize the new roadway connection and reroute to 159th Street/Ravinia Avenue.

Two background developments were identified in the project vicinity which would impact study area traffic volumes: a gas station on the southeast corner of 159th Street/Ravinia Avenue and a residential development at the southern terminus of Ravinia Avenue. Traffic volumes associated with the offsite developments were referenced from *Traffic Impact Study Costco Wholesale, Orland Park* (prepared by V3 Companies, dated June 25, 2025) and *Traffic Impact Study Proposed Residential Development, Orland Park, Illinois* (prepared by KLOA, dated August 22, 2024). Site-generated trips were then added to the Year 2033 background traffic projections. Trip assignment for adjacent development's associated with the Ravinia Avenue extension are provided in the appendix.

The resulting Year 2033 no-build traffic projections accounting for background growth, the Ravinia Avenue extension, and adjacent developments are presented in **Exhibit 8**.

Future (2033) Build Traffic Projections

To estimate future traffic volumes with the proposed development, the total site-generated trips (Exhibit 7) were added to the background traffic projections (Exhibit 8). The resulting Year 2033 build traffic projections are depicted in **Exhibit 9**.

Future Geometry and Traffic Control

The following provides a summary of future geometry and traffic control at the study intersections. A review of turn lane warrant and signal warrant criteria was completed to assess potential offsite improvements to accommodate site-generated traffic.

Turn Lane Warrant Analysis

For the analysis of future traffic conditions, turn lane warrants were evaluated at the proposed site driveways and study intersections using guidelines in the IDOT *Bureau of Design and Environment (BDE) Manual* and traffic volume projections for the Year 2033 no-build scenario (Exhibit 8) and for the Year 2033 build scenario (Exhibit 9)

The IDOT *BDE Manual* does not provide specific guidelines for unsignalized intersections along a four-lane roadway with a design speed under 50 mph (159th Street and LaGrange Road have posted speed of 40 mph, design speed of 45 mph; 161st Street was assumed to have a posted speed of 30 mph, design speed of 35 mph), or specific guidelines for a six-lane highway; therefore, the guidelines for a four-lane highway with a posted speed limit of 50 mph or greater were referenced (Figure 36-3.B). For a highway with 1,200 vehicles or more in one direction and a minimum of 40 right-turn vehicles during the peak hours, a right-turn lane should be considered. For a highway with less than 500 vehicles in one direction and a minimum of 90 right-turn vehicles during the peak hours, a right-turn lane should be considered. Other factors to be considered when evaluating the need for right-turn lanes include uniformity along the corridor and engineering judgement.

The IDOT *BDE Manual* states the left-turn lanes are to be provided on divided highways, regardless of traffic volumes. Other factors to be considered when evaluating the need for left-turn lanes include uniformity along the corridor, signalized intersections where the left-turn volume is anticipated to be greater than 75 vehicles, with over 300 vehicles warranting consideration of dual left-turn lanes, and engineering judgement.

Based on the IDOT *BDE Manual* criteria, a summary of the turn lane warrant review is outlined below.

Year 2033 No-Build

159th Street / Ravinia Avenue

- An eastbound right-turn lane should be provided; projected traffic volumes satisfy warrant criteria in the weekday evening and Saturday midday peak hour.
 - Based on the design standards outlined in the IDOT BDE Manual, with a design speed of 45 mph the right-turn lane should provide 185 feet of storage and a 200-foot taper.

Year 2033 Build

159th Street / Ravinia Avenue

- An additional northbound left-turn lane should be provided; projected traffic volumes satisfy warrant criteria in the weekday evening and Saturday midday peak hours.
 - To accommodate 95th percentile queues, the left-turn lane storage should be a minimum of 320 feet and due to spacing constraints a taper length of 100 feet should be provided.

LaGrange Road / 161st Street

- An additional northbound left-turn lane should be provided; projected traffic volumes satisfy warrant criteria in the weekday evening and Saturday midday peak hours.
 - To accommodate 95th percentile queues, the left-turn lane storage should be a minimum of 350 feet with a 220-foot taper per the IDOT *BDE Manual*.

159th Street / Access A

- An eastbound right-turn lane is not warranted based on IDOT *BDE Manual* volume criteria. Truck trips are generally expected to occur outside the peak hours; therefore, an eastbound right-turn lane was not included in the analysis of future conditions.

159th Street / North Private Drive-Access B

- An eastbound right-turn lane should be provided; projected traffic volumes satisfy warrant criteria in the weekday evening and Saturday midday peak hours.
 - Based on the spacing distance between Access A and Access B, the turn lane should provide 175 feet of storage with a 100-foot taper.

LaGrange Road / Access C

- A southbound right-turn lane should be provided; projected traffic volumes satisfy criteria in all peak hours analyzed.
 - Based on design standards outlined in the IDOT *BDE Manual*, with a design speed of 45 mph the right-turn lane should provide 185 feet of storage and a 200-foot taper.

161st Street / Access D

- A westbound right-turn lane should be provided; projected traffic volumes satisfy criteria in the weekday evening and Saturday midday peak hours.
 - Based on spacing distance between Access D and East Access, the turn lane should provide 90 feet of storage with a 25-foot taper.

Signal Warrant Analysis

Signal warrant analyses were performed for the intersection of LaGrange Road/161st Street according to criteria set by the *Manual on Uniform Traffic Control Devices (MUTCD)*. The following warrants were evaluated: Warrant 1 (Eight-Hour Vehicular Volume), Warrant 2 (Four-Hour Vehicular Volume), and Warrant 3 (Peak Hour).

Using the 12-hour turning movement count data collected at the intersection of LaGrange Road/161st Street, background traffic projections were developed by applying an average 0.61 percent growth rate (Table 4.1) through Year 2033 and the change in distribution of existing traffic caused by the Ravinia Avenue extension as discussed to estimate future no-build conditions. Site-generated traffic projections were estimated for the 12-hour period using time-of-day distribution data for LUC 815, Free-Standing Discount Store and LUC 820, Strip Retail Plaza (<40k) provided in Appendix A from the ITE *Trip Generation Manual*, 11th Edition. LUC 820 was utilized for the outlots due to ITE having limited data available for LUC 821. These trips were then assigned to the intersection of LaGrange Road/161st Street following the distribution assumptions previously discussed.

The 12-hour traffic projections and signal warrant analysis results for the no-build and build scenarios are provided in **Table 4.2** and **Table 4.3**, respectively. A summary of the three warrants evaluated is provided below.

Table 4.2. Future (2033) No-Build Signal Warrant Summary – LaGrange Road / 161st Street

Time	Major Street (LaGrange Road)	Minor-Leg Approach (161 st Street)	Warrant 1A ¹	Warrant 1B ¹	Warrant 2	Warrant 3

4:00 PM	4139	308	Yes	Yes	Yes	Yes
5:00 PM	4027	277	Yes	Yes	Yes	Yes
Total Number of Hours Warrant Satisfied			9	10	10	10
Warrant Satisfied?			Yes	Yes	Yes	Yes

¹To satisfy warrant criteria for the combined Conditions A & B, the minimum volume thresholds for both conditions must be met.

Warrant 1: Eight-Hour Vehicular Volume

According to the criteria outlined in Table 4C-1 of the *MUTCD*, traffic volumes at LaGrange Road/161st Street must meet the following criteria for Warrant 1 for at least eight hours on an average day.

- Condition A: 600 vehicles per hour (VPH) on LaGrange Road (major street); 200 VPH on 161st Street (minor street); or
- Condition B: 900 vehicles per hour (VPH) on LaGrange Road (major street); 100 VPH on 161st Street (minor street)

Per Table 4.2, no-build traffic projections do not satisfy the eight-hour criteria for Warrant 1. As shown in Table 4.3, the Future (2033) Build traffic volumes meet the eight-hour minimum requirement for Warrant 1.

Warrant 2: Four-Hour Vehicular Volume

In order to meet the Warrant 2 standards for the installation of a traffic signal, traffic volumes must meet the volume criteria for at least four hours on an average day. The traffic volumes presented in Table 4.2 and Table 4.3 were compared to the Warrant 2 criteria outlined in Figure 4C-1 of the *MUTCD*. Based on the lane geometry at LaGrange Road/161st Street and the volume of traffic on LaGrange Road (both approaches), the warrant threshold volume criteria for 161st Street is 115 vehicles per hour under Warrant 2. The projected build traffic volumes for 161st Street exceed this threshold for 10 hours; and therefore, a traffic signal is warranted under Warrant 2.

Warrant 3: Peak Hour

The traffic volumes presented in in Table 4.3 were compared to the Warrant 3 criteria outlined in Figure 4C-3 of the *MUTCD*. Based on the lane geometry at LaGrange Road/161st Street and the volume of traffic on LaGrange Road (both approaches), the warrant threshold volume criteria for 161st Street is 150 vehicles per hour under Warrant 3. As summarized in Table 4.3, the hourly volume on 161st Street exceeds the threshold 10 times during the 12-hour period; and therefore, a traffic signal is warranted under Warrant 3.

Traffic Control Summary

Based on the results of the signal warrant analysis, a traffic signal was warranted for the intersection of LaGrange Road/161st Street in the analysis of future build conditions. For purposes of the analysis, a cycle length of 120 seconds during the weekday morning peak hour and 130 seconds during the weekday evening and Saturday midday peak hours were assumed, consistent with existing signal timings at the intersection of LaGrange Road/159th Street. Splits were optimized at the intersection of LaGrange Road/161st Street. Based on coordination with the Village, this intersection is currently under design for signal control.

For the site access driveways, minor-leg stop control should be posted for outbound traffic. Access A, Access B, and Access C should be designed to allow RIRO movements only; “No Left Turn” signage should be posted for outbound traffic.

Future (2033) Capacity Analysis

Based on projected traffic volumes and future geometry assumptions, capacity results were identified for the study intersections under Year 2033 no-build and build conditions. For purposes of the analysis of future conditions, the existing signal timings for 159th Street/Ravinia Avenue and LaGrange Road/159th Street were utilized. For the analysis of no-build conditions, the intersection of LaGrange Road/161st Street was assumed to operate under minor-leg stop control, consistent with existing conditions. For the build scenario, a traffic signal was included for the intersection of LaGrange Road/161st Street.

The results of the no-build and build capacity analyses are summarized in **Table 4.4** and **Table 4.6**, respectively. The results of the no-build and build queueing analyses are summarized in **Table 4.5** and **Table 4.7**, respectively. The results are based on Synchro’s HCM 7th Edition reports. Copies of the Synchro reports are provided in the appendix.

¹Left-turn movement operates at LOS E.

²Left-turn movement operates at LOS F.

³Through movement operates at LOS E.

⁴Left-turn and through movements operate at LOS E.

⁵Through movement operates at LOS F.

With the addition of background traffic growth, adjacent development's site traffic, and the Ravinia Avenue extension the study intersections are expected to operate similar to existing conditions with exceptions noted below. Consistent with existing conditions, most of the through movements on 159th Street and LaGrange Road would not meet IDOT criteria of LOS C or better for SRA routes.

At the intersection of 159th Street/Ravinia Avenue, the southbound through movement is anticipated to operate at LOS E during the weekday morning peak hour compared to LOS D under existing conditions. During the weekday evening peak hour, the westbound approach is projected to operate as LOS D compared to LOS C under existing conditions.

During the weekday evening peak hour at the LaGrange Road/159th Street intersection, both the eastbound and westbound through movements operate at LOS F compared to LOS E under existing conditions.

At the intersection of LaGrange Road/161st Street, the northbound left-turn movement operates at LOS F compared to LOS D under existing conditions.

△ -Minor-Leg Stop-Controlled Intersection

¹Queue length in feet based on an assumed 25' vehicle. .

²Exceeds storage lane length.

³Exceeds storage lane and taper length.

With the addition of background traffic growth, the projected 95th percentile queue spillback anticipated is expected to be consistent with existing conditions with the following exceptions. At the intersection of 159th Street/Ravinia Avenue during the weekday evening peak hour, the southbound right-turn queue is projected to exceed the overall turn lane length (inclusive of storage and taper). At the intersection of LaGrange Road/159th Street, during the Saturday midday peak hour the westbound left-turn queue is projected to exceed the turn lane . At the intersection of LaGrange Road/161st Street during each peak hour, the eastbound right-turn queue is projected to exceed the overall turn lane length (inclusive of storage and taper). Additionally, the northbound left-turn queue is projected to exceed the turn lane storage under the Saturday midday peak hour, and the overall turn lane length (inclusive of storage and taper) under the weekday evening peak hour.

★ -Signalized Intersection

△ -Minor-Leg Stop-Controlled Intersection

¹Left-turn movement operates at LOS E.

²Left-turn movement operates at LOS F.

³Left-turn and through movements operate at LOS F.

⁴Through movement operates at LOS F.

The addition of site-generated traffic is not expected to materially impact the study intersections with installation of the geometric and traffic control improvements previously identified. Under the future build scenario, the intersections are generally projected to operate similar to no-build conditions, with exceptions noted below.

At the intersection of 159th Street/Ravinia Avenue during the Saturday midday peak hour, the westbound approach is projected to operate at LOS E (compared to LOS D under no-build conditions) with the change in delay being approximately 13 seconds per vehicle and within two seconds of acceptable levels. The northbound left-turn movement is anticipated to operate at LOS E during the weekday evening and Saturday midday peaks, while the approaches are anticipated to operate at an acceptable LOS D.

At the intersection of LaGrange Road/159th Street during the Saturday midday peak hours, the eastbound, westbound, and northbound approaches LOS drops one letter grade, bringing the overall intersection to LOS E. During the weekday evening peak hour, the eastbound approach operates at LOS F compared to LOS E during no-build conditions and the overall intersection operates at LOS E compared to LOS D during the no-build conditions. During the weekday AM peak hour, the eastbound approach operates at LOS E compared to LOS D during no build conditions.

At the intersection of LaGrange Road/161st Street, the westbound approach is projected to operate at LOS E during the peak hours. The projected delay is a function of the traffic signal priority given to north-south through movements along the SRA route (i.e., LaGrange Road). As a result, relatively limited green time is allocated to 161st Street, which is projected to serve no more than 50 vehicles in a peak hour.

Access A, Access D, Access E, and Access F are projected to operate with acceptable delay at LOS D or better during the peak hours, with one exception. During the Saturday midday peak hour, Access D is projected to operate at LOS E for outbound traffic.

★ -Signalized Intersection △ -Minor-Leg Stop-Controlled Intersection

¹Queue length in feet based on an assumed 25' vehicle.

²Exceeds storage lane length.

³Exceeds storage lane and taper length.

With the addition of site-generated, the 95th percentile queue spillback anticipated is expected to be consistent with no-build conditions with exceptions noted below.

At the intersection of LaGrange Road/159th Street minor signal timing adjustments were made and should be considered to limit queue spillback of the eastbound left-turn lane. During the weekday evening and Saturday midday peak hours, the northbound right-turn queue projection is anticipated to exceed the overall turn lane length (inclusive of storage and taper).

At the intersection of LaGrange Road/161st Street, the westbound right-turn queue projection is anticipated to exceed the overall turn lane length (inclusive of storage and taper). As previously discussed, this approach gets relatively limited green time due to serving no more than 50 vehicles in the peak hour.

At the site driveways, the 95th percentile queues are expected to be approximately nine (9) vehicles (205 feet) or less during the peak hours. With the highest on-site queues occurring for outbound traffic at Access B and Access D traffic, “Do No Block Intersection” signage should be considered at the adjacent internal intersections to maintain free-flow inbound traffic.

5. FUTURE CONDITIONS (2050)

This section of the report outlines the anticipated impacts to the proposed site plan and develops future traffic projections for analysis for Year 2050.

Development Characteristics

The development characteristics remain consistent with Year 2033 conditions. The development includes an approximately 230,667 square-foot retail building and a total of 45,000 square feet of retail/restaurant buildings.

Trip Generation

Trip generation was calculated using data from the ITE *Trip Generation Manual*, 11th Edition. Trip generation for the primary site and outlots would be consistent with Year 2033 conditions, as summarized in Table 3.1. Similarly, trip generation projections would be unchanged, as shown in Table 3.2.

Future (2050) No-Build Traffic Projections

Background traffic growth estimates were developed using Year 2050 data from the Chicago Metropolitan Agency for Planning (CMAP). As summarized in Table 4.1 the average annual growth rate for the area roadway network is approximately 0.61 percent. An annual compounded growth rate of 0.61 percent was applied for the period of twenty-five years to reflect traffic growth between Year 2025 (existing traffic counts) and future Year 2050. Consistent with No-Build (2033) conditions, the Ravinia Avenue extension and two known offsite developments in the project vicinity were included in the No-Build (2050) traffic projections.

The resulting Year 2050 no-build traffic projections are presented in **Exhibit 10**.

Future (2050) Build Traffic Projections

To estimate future traffic volumes with the proposed development, the total site-generated trips (Exhibit 7) were added to the background traffic projections (Exhibit 10). The resulting Year 2050 build traffic projections are depicted in **Exhibit 11**.

Future Geometry and Traffic Control

The following provides a summary of future geometry and traffic control at the study intersections. A review of turn lane warrants and signal warrant criteria was completed to assess potential offsite improvements to accommodate site-generated traffic.

Turn Lane Warrant Analysis

For the analysis of future traffic conditions, turn lane warrants were reevaluated at the proposed site driveways and study intersections using guidelines in the IDOT *Bureau of Design and Environment (BDE) Manual* and traffic volume projections for the Year 2050 no-build (Exhibit 10) and build (Exhibit 11) scenarios. Based on the analysis, all turn lanes identified under Year 2033 conditions continue to be warranted in Year 2050 and were included in the analyses. It is to be noted that under No-Build (2050) conditions, at the 159th Street/Ravinia Road intersection, the northbound left-turn volumes meet warranting criteria for dual-left turn lanes due to the impacts of the Ravinia Avenue extension.

Signal Warrant Analysis

Based on the analysis of Year 2033 conditions and discussions with the Village of Orland Park, the traffic signal at LaGrange Road/161st Street with the addition of dual northbound left-turn lanes was assumed in Year 2050 conditions.

Future (2050) Capacity Analysis

Based on projected traffic volumes and future geometry assumptions, capacity results were identified for the study intersections under Year 2050 no-build and build conditions.

The results of the no-build and build capacity analyses are summarized in **Table 5.1** and **Table 5.3**, respectively. The no-build and build 95th percentile queues are summarized in **Table 5.2** and **Table 5.4**, respectively. The results are based on Synchro's HCM 7th Edition reports. Copies of the Synchro reports are provided in the appendix.

★ -Signalized Intersection

△ -Minor-Leg Stop-Controlled Intersection

¹Left-turn movement operates at LOS E.

²Left-turn movement operates at LOS F.

³Right-turn and through movement operate at LOS E.

⁴Through movement operates at LOS E.

With the addition of background traffic growth, adjacent development's site traffic, and the Ravinia Avenue extension, the study intersections are expected to operate similar to Year 2033 no-build conditions with exceptions noted below. Consistent with existing conditions, most of the through movements on 159th Street and LaGrange Road would not meet IDOT criteria of LOS C or better for SRA routes.

At the intersection of 159th Street/Ravinia Avenue the eastbound approach is projected to operate at LOS E during the weekday evening peak hour (compared to LOS D under Year 2033 no-build conditions).

At the intersection of LaGrange Road/159th Street the eastbound and westbound approaches are projected to operate at LOS F during the weekday evening peak hour (compared to LOS E during no-build 2033 conditions), bringing the overall intersection to a LOS E (compared to LOS D during no-build 2033 conditions). The westbound and northbound approaches are projected to operate at LOS E during the weekday evening peak hour (compared to LOS D during no-build 2033 conditions), bringing the overall intersection to a LOS E (compared to LOS D during no-build 2033 conditions).

With the improvements identified at the LaGrange Road/161st Street intersection the westbound approach is projected to operate at LOS E during the weekday evening peak hour. The projected delay is a function of the traffic signal priority given to north-south through movements along the SRA route (i.e., LaGrange Road). As a result, relatively limited green time is allocated to 161st Street, which is projected to serve no more than 50 vehicles in a peak hour

★ -Signalized Intersection △-Minor-Leg Stop-Controlled Intersection

¹Queue length in feet based on an assumed 25' vehicle.

²Exceeds storage lane length.

³Exceeds storage lane and taper length.

With the addition of background traffic growth through year 2050, adjacent development's site traffic, and the Ravinia Avenue extension, the projected 95th percentile queue spillback anticipated is expected to be consistent with no-build 2033 conditions with the following exceptions.

At the intersection of 159th Street/Ravinia Avenue during the weekday morning peak hour, the southbound left-turn queue is projected to exceed the storage space. Additionally, during the Saturday midday peak hour, the southbound right-turn queue is projected to exceed the overall turn lane length (inclusive of storage and taper).

At the intersection of 159th Street/LaGrange Road during the weekday evening and Saturday midday peak hour, the northbound right-turn queue is projected to exceed the overall turn lane length (inclusive of storage and taper). Additionally, during the Saturday midday peak hour the southbound right-turn queue is projected to exceed the overall turn lane length (inclusive of storage and taper).

At the intersection of LaGrange Road/161st Street during the weekday evening peak hour, the northbound left-turn queue is projected to exceed the turn lane storage.

* -Signalized Intersection △ -Minor-Leg Stop-Controlled Intersection

¹Queue length in feet based on an assumed 25' vehicle.

²Exceeds storage lane length.

³Exceeds storage lane and taper length.

With the addition site-generated traffic the projected 95th percentile queue spillback anticipated is expected to be similar to no-build 2050 or 2033 build conditions with the following exceptions.

At the intersection of 159th Street/Ravinia Avenue during the weekday morning peak hour the southbound left-turn queue is projected to exceed the turn lane storage, while during weekday evening and Saturday midday peak hours, queue is projected to exceed the overall turn lane length (inclusive of storage and taper).

At the intersection of LaGrange Road/159th Street during the Saturday midday peak hour, the eastbound left-turn and southbound right-turn queues are projected to exceed the overall turn lane length (inclusive of storage and taper) by approximately 10 feet (less than one vehicle).

At the intersection of LaGrange Road/161st Street during the Saturday midday peak hour, the eastbound left-turn and westbound right-turn queues are expected to exceed the overall turn lane length (inclusive of storage and taper), with the northbound left-turn queue expected to exceed the turn lane storage, but would be accommodated for with the proposed geometry.

6. RECOMMENDATIONS & CONCLUSIONS

Based on Kimley-Horn's review of the proposed site plan and evaluation of existing and future traffic conditions, the following recommendations were identified to facilitate access to the site and limit the impact of the proposed development on the surrounding area's traffic conditions:

Year 2033 No-Build

Ravinia Avenue Extension

- Per coordination with the Village of Orland Park, Ravinia Avenue will be extended east to connect to 161st Street by 2033.

159th Street / Ravinia Avenue

- Install an eastbound right-turn lane. Per design standards outlined in the IDOT *BDE Manual*, the turn lane should provide 185 feet of storage with a 200-foot taper.
- The eastbound right-turn lanes should be considered with the Ravinia Avenue extension.

Year 2033 Build

LaGrange Road / 159th Street

- Consider signal timing adjustments to limit queue spillback of the eastbound left-turn movement.

159th Street / Ravinia Avenue

- Install an additional northbound left-turn lane. To accommodate 95th percentile queues, the left-turn lane storage should be a minimum of 320 feet and based on space constraints a taper length of 100 feet should be provided.
- The dual northbound left-turn lanes should be considered with the Ravinia Avenue extension.

LaGrange Street / 161st Street

- Install a traffic signal. Per IDOT standards, the traffic signal will be installed once traffic volumes satisfy *MUTCD* warrant criteria. Based upon coordination with the Village of Orland Park, the intersection is currently under design for signal control and should be designed per IDOT standards.
- Install an additional northbound left-turn lane. To accommodate 95th percentile queues, the left-turn lane storage should be a minimum of 350 feet with a 220-foot taper per the IDOT *BDE Manual*.
- The dual northbound left-turn lanes should be considered with the Ravinia Avenue extension and/or signal plans currently under design at the intersection.

159th Street / Access A

- Limit access to RIRO movements only. Install "No Left Turn" signage for outbound traffic.
- Provide a single inbound and a single outbound lane.
- Design Access A to accommodate truck turning movements.
- Install minor-leg stop control with a stop bar for outbound traffic.

159th Street / North Private Drive-Access B

- Limit access to RIRO movements only. Install “No Left Turn” signage for outbound traffic.
- Provide an eastbound right-turn lane. Based on the spacing distance from Access A, the turn lane should provide 175 feet of storage with a 100-foot taper.
- Design Access B to include a single inbound lane and a single outbound lane.
- Install minor-leg stop control with a stop bar for outbound traffic.
- Install “Do Not Block Intersection” signage for northbound traffic approaching the internal/onsite intersection south of 159th Street in order to maintain free-flow condition for inbound site traffic.

LaGrange Road / Access C

- Provide a southbound right-turn lane. Per design standards outlined in the IDOT *BDE Manual*, the turn lane should provide 185 feet of storage with a 200-foot taper.
- Design Access C to accommodate RIRO movements only. Install “No Left Turn” signage for outbound traffic.
- Provide a single inbound and a single outbound lane.
- Install minor-leg stop control with a stop bar for outbound traffic.

161st Street / West Access-Access D

- Provide a westbound right-turn lane. Based on the spacing distance between Access D and East Access, the turn lane should provide 90 feet of storage with a 25-foot taper.
- Provide a single inbound lane and a single outbound lane.
- Install minor-leg stop control with a stop bar for outbound traffic.
- Install “Do Not Block Intersection” signage for southbound traffic approaching the internal/onsite intersection north of 161st Street in order to maintain free-flow condition for inbound site traffic.

161st Street / Access E

- Provide a single inbound lane and a single outbound lane.
- Install minor-leg stop control with stop bars for outbound traffic.

161st Street / Access F

- Provide a single inbound lane and a single outbound lane.
- Install minor-leg stop control with stop bars for outbound traffic.

Regardless of the final configuration of the intersection geometrics, several additional items should be taken into consideration when preparing site and roadway improvement plans for the subject development. As the site design progresses, care should be taken with landscaping, signage, and monumentation at the site access locations to ensure that adequate horizontal sight distance is maintained. If alterations to the site plan or land use should occur, changes to the analysis provided within this traffic impact study may be needed.

DATA FROM ITE *TRIP GENERATION MANUAL*, 11TH EDITION

Land Use: 815

Free-Standing Discount Store

Description

A discount store is similar to a free-standing discount superstore (Land Use 813) with the exception that it does not contain a full-service grocery department. It is also similar to a department store (Land Use 875) with the exception that it generally offers centralized cashiering and sells products that are advertised at discount prices. Discount stores offer a variety of customer services and typically maintain long store hours 7 days a week. The stores included in this land use are often the only ones on the site but they can also be found in mutual operation with a related or unrelated garden center and/or service station. A free-standing discount store can also be found on a separate parcel within a retail complex, with or without its own dedicated parking. Freestanding discount superstore (Land Use 813), variety store (Land Use 814), and department store (Land Use 875) are related uses.

Additional Data

A garden center contained within the principal outside faces of the exterior building walls is included in the reported gross floor areas. An outdoor or fenced-in area outside the principal outside faces of the exterior building walls is excluded.

To assist in the future analysis of this land use, it is important to collect and include information on the presence and size of garden centers, outdoor fenced-in space and service stations in trip generation data submissions.

The sites were surveyed in the 1980s, the 1990s, the 2000s, and the 2010s in California, Connecticut, Delaware, Florida, Maryland, Massachusetts, Minnesota, New Hampshire, New Jersey, New York, Oregon, Pennsylvania, South Dakota, and Wisconsin.

Land Use: 821

Shopping Plaza (40-150k)

Description

A shopping plaza is an integrated group of commercial establishments that is planned, developed, owned, and managed as a unit. Each study site in this land use has between 40,000 and 150,000 square feet of gross leasable area (GLA). The term “plaza” in the land use name rather than “center” is simply a means of distinction between the different shopping center size ranges. Various other names are commonly used to categorize a shopping plaza within this size range, depending on its specific size and tenants, such as neighborhood center, community center, and fashion center.

Its major tenant is often a supermarket but many sites are anchored by home improvement, discount, or other stores. A shopping plaza typically contains more than retail merchandising facilities. Office space, a movie theater, restaurants, a post office, banks, a health club, and recreational facilities are common tenants. A shopping plaza is almost always open-air and the GLA is the same as the gross floor area of the building.

The 150,000 square feet GLA threshold value between shopping plaza and shopping center (Land Use 820) is based on an examination of trip generation data. For a shopping plaza that is smaller than the threshold value, the presence or absence of a supermarket within the plaza has a measurable effect on site trip generation. For a shopping center that is larger than the threshold value, the trips generated by its other major tenants mask any effects of the presence or absence of an on-site supermarket.

The 40,000 square feet GFA threshold between shopping plaza and strip retail plaza (Land Use 822) was selected based on an examination of the overall shopping center/plaza database. No shopping plaza with a supermarket as its anchor is smaller than 40,000 square feet GLA.

Shopping center (>150k) (Land Use 820), strip retail plaza (<40k) (Land Use 822), and factory outlet center (Land Use 823) are related uses.

Land Use Subcategory

The presence or absence of a supermarket in a shopping plaza has been determined to have a measurable effect on site trip generation. Therefore, data are presented for two subcategories for this land use: sites with a supermarket anchor and sites without a supermarket.

Additional Data

The technical appendices provide supporting information on time-of-day distributions for this land use. The appendices can be accessed through either the ITETripGen web app or the trip generation resource page on the ITE website (<https://www.ite.org/technical-resources/topics/trip-and-parking-generation/>).

The sites were surveyed in the 1980s, the 1990s, the 2000s, and the 2010s in Alberta (CAN), British Columbia (CAN), California, Connecticut, District of Columbia, Florida, Georgia, Illinois, Indiana, Iowa, Kansas, Kentucky, Maine, Maryland, Massachusetts, Minnesota, Nevada, New Jersey, New York, Ontario (CAN), Oregon, Pennsylvania, South Dakota, Texas, Vermont, Virginia, Washington, and Wisconsin.

BACKGROUND DEVELOPMENTS TRAFFIC IMPACT STUDIES

WAREHOUSE
RIGHT-IN DWY

[338]
32 (89) [115]

Existing Rerouted Traffic Volumes with Ravinia Extension

The construction of the Ravinia Avenue extension will result in an adjustment to the existing traffic patterns in the area as adjacent developments will have additional options to access the area roadways and vehicles will be able to use the new extension to avoid some travel movements and intersections. For instance, currently traffic from the south on LaGrange Road has to use 159th Street to access the Costco, but with the extension, those trips can now use Ravinia Avenue.

In coordination with CMAP, it is anticipated that approximately four percent of the average daily traffic (38,900 vehicles reduced to 37,700 vehicles) along LaGrange Road south of 159th Street will utilize the Ravinia Avenue extension. Therefore, a four percent reduction of the northbound and southbound through volumes along LaGrange Road were adjusted and rerouted to use the Ravinia Avenue Extension.

Costco Rerouted Traffic Volumes with Ravinia Extension

Similar to the existing rerouted traffic volumes along LaGrange Road and 159th Street, it is anticipated that Costco traffic will be rerouted to utilize the new access connecting south of LaGrange Road to 159th Street to the west. Based on the existing Costco traffic patterns, it is estimated that approximately 15 percent of the Costco generated traffic volumes travel to and from the south on LaGrange Road. Therefore, 15 percent of the Costco generated traffic volumes has been rerouted to utilize the Ravinia Extension.

In summary, the future 2050 peak hour traffic volumes the background growth in the area based on CMAP projections, the traffic from the two new developments south and east of Costco, and a redistribution of traffic from 159th Street and LaGrange Road that would likely use the new extension to bypass the 159th Street and LaGrange Road intersection or travel on Ravinia Avenue north of 159th Street, and the redistribution of Costco traffic using the Ravinia Avenue extension. Appendix H includes a summary of traffic volume exhibits that illustrate the development of the 2050 traffic volumes.

The existing rerouted traffic volumes, the adjacent development traffic volumes, and the Costco rerouted traffic volumes total project trips are added to the background volume to obtain the future with project traffic volumes for the study area intersections. Future with project traffic volumes are depicted in Figure 10.

Figure 11 illustrates the proposed lane configuration for the 2050 future with Ravinia Extension scenario.

CMAQ YEAR 2050 TRAFFIC PROJECTIONS

April 25, 2025

Alainie Sawtelle, E.I.
Kimley-Horn
4201 Winfield Road
Suite 600
Warrenville, IL 60555

Subject: 159th Street from 104th Avenue to 94th Avenue
IDOT

Dear Ms. Sawtelle:

In response to a request made on your behalf and dated April 24, 2025, we have developed year 2050 average daily traffic (ADT) projections for the subject location.

ROAD SEGMENT	Current ADT	Year 2050 ADT
159th St, west of 104th Ave	21,300	25,200
159th St, from 104th St to LaGrange Rd	24,200	28,600
159th St east of LaGrange Rd	35,000	41,400
104th Avenue south of 159th St	3,700	4,380
Ravinia Ave north of 159th St	5,600	6,600
LaGrange Rd north of 159th St	33,600	39,600
LaGrange Rd south of 159th St	33,500	39,500

Traffic projections are developed using existing ADT data provided in the request letter and the results from the December 2024 CMAP Travel Demand Analysis. The regional travel model uses CMAP 2050 socioeconomic projections and assumes the implementation of the ON TO 2050 Comprehensive Regional Plan for the Northeastern Illinois area. The provision of this data in support of your request does not constitute a CMAP endorsement of the proposed development or any subsequent developments.

If you have any questions, please call me at (312) 386-8806 or email me at jrodriguez@cmap.illinois.gov
